Economic Analysis: Water Supply

I. Introduction

This attachment provides an overview of the water supply costs and benefits of the Proposal for the Greater Los Angeles County Region (Region) and identifies the water supply costs and benefits of each individual project. Because several projects would provide multiple benefits, Table 7-1 below contains a summary of the costs and benefits for all projects.

This attachment contains a narrative description of the expected water supply benefits of each project. Where possible, each benefit was quantified and presented in physical or economic terms. In cases where quantitative analyses were not feasible, this attachment provides complimentary qualitative analyses. In addition, this attachment provides a description of economic factors that may affect or qualify the amount of economic benefits to be realized. This attachment also includes a discussion regarding uncertainties about the future that might affect the level of benefit received.

This attachment also contains a narrative description of the expected costs that may be incurred to implement and operate the Proposal, and to achieve benefits from each project.

Table 7.1: Proposal Project Costs and Benefits Summary

Project	Agency	Total Present Value Project Costs	Total Present Value Project Benefits				Benefit/ Cost Ratio
			Water Supply	Flood Damage Reduction	Water Quality & Other	Total	
(a)	(b)	(c)	(d)	(e)	(f)	(g) (d) + (e) + (f)	(h) f/(c)
Hahamongna Basin Multi-Use Project	Arroyo Seco Foundation	$7,340,486	$50,567,382	$0	$689,771	$51,257,154	6.98

Leo J. Vander Lans Advanced Water Treatment Plant Expansion	Water Replenishment District of Southern California	$54,232,760	$45,285,312	$0	$0	$45,285,312	0.84
Whittier Narrows Conservation Pool Project	Water Replenishment District of Southern California	$4,406,336	$7,781,351	$0	$0	$7,781,351	1.8
Water and Energy Efficiency in the School and Hotel/Motel Sectors	West Basin Municipal Water District	$475,660	$1,028,177	$0	$1,713,048	$2,741,224	5.76
TOTAL		**$164,829,606**	**$399,212,426**	**$0**	**$3,981,457**	**$403,193,881**	**2.45**

Additional water supplies may be produced locally within the Metropolitan Water District of Southern California (MWD) service area through conservation, recycling, groundwater recharge, groundwater extraction, and other sources will reduce the demand for imported water by the Los Angeles Region. MWD member agencies will substitute locally produced

water supplies for imported water from MWD, assuming the locally produced water is less expensive than imported water. The value of adding new local supplies to satisfy local demand in place of imported water can thus be estimated based on the avoided cost of purchasing imported water.

The cost savings arising from reducing demands for imported water should be estimated based on the projected future cost of imports, at the margin. This in turn requires a projection of the cost of providing additional imported water at the levels needed in the future if local resources are not enhanced in conjunction with this Proposal. The key empirical question for valuation is thus, "What is the future cost, at the margin, of acquiring another acre-foot (AF) of imported water, and having it delivered (and treated, where applicable) to the users of the local supply alternatives?"[1]

There are several empirical and conceptual challenges to forecasting the future avoided cost of import water. This Attachment discusses these issues and how they were addressed to develop the avoided water supply costs that are used to evaluate the benefits of those projects that provide local water (or conserve water) in the Los Angeles region.

Table 7.2 compares Tier 1 water rate projections published by MWD for 2005-2009 with actual water rates to illustrate differences in forecasted and actual water rates. As Table 7.2 shows, the margin of error associated with the forecast increases with period of time for which rates are forecast. This analysis requires MWD water rates be forecast through 2060 to match the length of time over which benefits of reduced demand for imported water accrue.

Table 7.2: Comparison of Projected and Actual MWD Tier 1 Water Rates

Year	Projected		Actual		Difference[a]	
	Untreated	Treated	Untreated	Treated	Untreated	Treated
2005	$331	$443	$331	$443	0.0%	0.0%
2006	$335	$460	$331	$453	-1.2%	-1.5%
2007	$345	$476	$331	$478	-3.9%	0.4%
2008	$361	$497	$351	$508	-2.6%	2.3%
2009	$379	$523	$436	$620	15.0%	18.7%

Notes: *All dollar values are nominal. Projected Tier 1 MWD water rates are sourced from the 2004/05 Long Range Finance Plan, whereas actual MWD Tier 1 water rates are sourced from the MWD "Water Rates and Charges". Projected MWD Tier 1 water rates are computed as the midpoint of the low and high projected rates.*

[1] Cost of treatment and delivery need to be included in the avoided import water costs, to provide a suitable "apples-to-apples" comparison of import water costs to the local supplies. This is because the costs used in these analyses for local supplies are generally inclusive of treatment and delivery.

Detailed information and background regarding the qualitative and quantitative costs and water supply benefits of each individual project follows.

II. Hahamongna Basin Multi-Use Project

Water Supply Benefits

This project will result in water supply benefits associated with avoided imported water supply purchases and improved water supply reliability (summarized in Table 7.4). The magnitude of benefits, monetized when possible, is reported in Table 7.8. Detailed cost and benefit information associated with the project, including present value calculations, is presented in the attached tables.

Table 7.4: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Avoided water imports due to increased groundwater storage (Basin component)	Monetized	Local / Regional / Statewide
Avoided water imports due to increased water supplies (Canyon component)	Monetized	Local / Regional / Statewide
Improved water supply reliability	Qualitative	Local and Regional

Economic Analysis: Water Supply

Avoided Water Supply Purchases

This Project is expected to generate water savings through avoided purchase of imported water supply due to increased storage behind Devil's Gate Dam and increased water supplies due to the new diversion rubber dam that will direct flows from the Arroyo Seco into the existing spreading grounds. The avoided water supply purchases result from improvements to the Hahamongna Basin (Basin Component) and the Arroyo Seco Canyon (Canyon Component).

The avoided water purchase costs of water conserved in both the Basin and Canyon components has a present value benefit in 2009 dollars of approximately $50,567,382 assuming a 6% discount rate over the life of the Project.

Basin Component

The Basin component will increase groundwater supply and storage by removing layers of fine particle sediment down to the pre-dam elevation. This will allow adequate percolation for groundwater recharge during and between storm events. Under existing conditions, the capacity of the Hahamongna basin is 1,280 AF. This component of the Project includes excavation of an additional 155 AF, thereby increasing retention capacity to 1,435 AF.

In an average rainfall year, the Arroyo Seco watershed is estimated to produce runoff that will fill the Hahamongna Basin three times for a total of 4,300 AFY (3 x 1,435 AF). The underlying aquifer, the Raymond Basin, can store all of the stormwater captured by the Hahamongna Basin, thereby increasing local water supplies by the estimated amount of stormwater retention (4,300 AFY).

In recent years, Raymond Basin pumpers have had their pumping allotment reduced due to an observed drawdown of groundwater levels. With the implementation of this Project, and the eventual stabilization of groundwater levels, the pumping rights can be restored. If the Raymond Basin Management Board allows water agencies to pump, the value of this water will be the value of avoided alternative supplies (i.e. imports).

The avoided water purchase costs of untreated water conserved has a present value benefit in 2009 dollars of approximately $42,339,804 assuming a 6% discount rate over the 50-year life of the Project.

Canyon Component

Economic Analysis: Water Supply

The Canyon component of the Project will increase surface water diversions which would be pumped to the Monk Hill subarea for distribution. Under existing conditions, the diverted Canyon water totals approximately 2,775 AFY and piping infrastructure, with a capacity of 35 cubic feet per second (cfs), cannot transfer water at its full capacity. With implementation of the Project, water can be diverted at the full 35 cfs rate, increasing the total amount of water diverted by 875 AFY. By increasing the total amount of water supplies available, dependence on imported water will be reduced. For purposes of this analysis, any increase in pumping costs is assumed to be included as part of the O&M costs for the Project; therefore, the full value of imported water was used to monetize this water supply benefit. The avoided water purchase costs of untreated water conserved has a present value benefit in 2009 dollars of approximately $8,227,578 assuming a 6% discount rate over the life of the Project.

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. This Project provides for local water conservation and reduces imported water demand by increasing stormwater infiltration into the groundwater basin.

Although interest in water supply reliability is increasing, only a few studies have directly attempted to quantify its value. These studies indicate that residential and industrial (i.e., urban) customers seem to value supply reliability quite highly. Stated preference studies concluded that the annual value of water reliability ranged from $93 to $489 per household (updated to 2009 dollars) for total reliability (i.e., a 0% probability of their water supply being interrupted in times of drought).

The challenge of using such information to determine the value of the Project is interpreting the survey-based household monetary values. The values noted above reflect a willingness-to-pay to ensure complete reliability (zero drought-related use restrictions in the future), whereas these integrated projects enhance only overall reliability, but do not guarantee 100% reliability. Thus, the dollar values from the studies will probably overstate the reliability value provided by the Project. One simple way to roughly adjust for this “whole versus part” problem is to attribute a portion of the total value of reliability to the portion of the project that is solved by the project.

Distribution of Project Benefits and Identification of Beneficiaries

This Project will reduce the water supply costs to local agencies, which will result in lower water rates paid by local users (Table 7.5). The Project will also increase supplies available to MWD

users and mitigate the declining conditions of the Bay-Delta Ecosystem through reduced water exports.

Table 7.5: Project Beneficiaries Summary

Local	Regional	Statewide
Local Water Purveyors and Their Customers	MWD Customers	Bay-Delta Ecosystem

Project Benefits Timeline Description

The Basin component of the Project will provide water supply benefits beginning in 2013 through the Project lifetime (2060). The Canyon component of the Project will provide water supply benefits beginning in 2014 through the Project lifetime (2060).

Uncertainty of Benefits

The projected savings of this Project represent best estimates based on the latest available data (Table 7.6). Actual water savings will vary.

Table 7.6: Omissions, Biases, and Uncertainties and their Effect on the Project

Benefit or cost category	Likely impact on net benefits*	Comment
Avoided Imported Water Cost		
• Water rate forecast (MWD)	+/-	Margin of error implicit in forecasting
• Climate	+	The projections also are driven by "normal year" expectations, whereas dry year conditions will add additional cost pressures (and may move some of the imported water to higher cost Tier 2 levels).
• Regulatory/legal	+	Regulatory/ legal issues combine to make it more likely than not that the future availability of MWD-provided imported waters will be increasingly constrained, and that costs will escalate at rates higher than experienced in the recent past.

• Increased water demands	+	Other SWP users may increase their demand which may result in higher rates (holding supply constant)
Water Supply Reliability	+	The monetized value of added reliability is not included in the benefit-cost comparison. If we had added the present value benefit of improved water supply reliability in the overall benefit-cost analysis, it would increase net benefits.

* *Direction and magnitude of effects on net benefits*
+ Likely to increase net benefits relative to quantified estimates
++ Likely to increase net benefits significantly
- Likely to decrease net benefits
-- Likely to decrease net benefits significantly
+/- Uncertain

The "Without Project" Baseline

If this Project is not implemented, stormwater retention will remain at 1,280 AF. The amount of surface water diversions will not increase by an additional 875 AFY and imported potable water will continue to be purchased. .

Potential Adverse Effects from the Project

Any potential short-term impacts associated with Project construction will be mitigated. No long-term adverse effects are expected as a result of the proposed Project.

Project Costs

The total estimated cost for the Project is $7,264,739. When operations and maintenance costs through 2060 are considered, the present value in 2009 dollars is $7,340,486. Capital and maintenance costs will be expended in 2011 and 2012, with the largest capital cost in construction and implementation. The operation and maintenance costs are estimated to be $24,000 in 2013. Detailed cost information associated with the Project, including present value calculations is presented in Appendix 7.A.

Economic Analysis: Water Supply

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Project is provided in Table 7.A.1 of Appendix 7.A. For this analysis, the following assumptions were made:

(1) Replacement cost of trail and other amenities are included in the maintenance costs; and

(2) Fish & Game and other renewable permit costs were included in the maintenance costs for the Canyon component.

The annual water supply benefits of implementing the Project are provided in Table 7.A.2 of Appendix 7.A. For this analysis, the following assumptions were made:

(1) Pooling of water in the Basin is not currently possible due to inundation of Southern California Edison power poles, therefore there would be no benefit without this Project;

(2) If the Raymond Basin Management Board allowed water agencies to pump, the value of this water would be $2.5 million dollars per year;

(3) The 4,300 acre feet per year benefit is based on an average rainfall year; and

(4) The Canyon component will increase water diversion capacity and result in an increase in available groundwater supplies from 2,775 AFY to 3,650 AFY, and reducing water imports.

The annual costs of avoided projects are provided in Table 7.A.3 of Appendix 7.A. There are no annual costs of avoided projects.

The annual other water supply benefits of the Project are provided in Table 7.A.4 of Appendix 7.A. There are no annual other water supply benefits associated with implementation of this Project.

The total water supply benefits for the Project are provided in Table 7.A.5 of Appendix 7.A. These benefits are provided through avoided potable water purchases and have a present value of $50,567,382.

III. Citywide Smart Irrigation Control System and Recycled Water Improvements

Water Supply Benefits

This Project will result in water supply benefits associated with avoided water supply purchases and improved water supply reliability (Table 7.9). The magnitude of benefits, monetized when possible, is reported in Table 7.13 Detailed cost and benefit information associated with the Project, including present value calculations, is presented in Appendix 7.B.

Table 7.9: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Avoided water supply purchases	Monetized	Local / Regional / Statewide
Improved water supply reliability	Qualitative	Local and Regional

Avoided Water Supply Purchases

This Project is expected to generate water savings through avoided purchase of imported water supply. The cost of water for city-owned properties for the FY 09-10 was $144,345. Water savings from implementing a smart irrigation control system is estimated to be between 25% and 30% of FY 09-10 usage. Therefore, the water savings will be approximately $40,000/year. Based on the Las Virgenes Municipal Water District's (LVMWD's) water rate of $700/acre foot (AF), the water savings will be 57 AF/year. Therefore, the avoided water purchase costs of water conserved over the 50-year life of the Project has a present value benefit in 2009 dollars of approximately $849,274 assuming a 6% discount rate.

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. This Project provides for imported water conservation and reduces imported water demand.

Although interest in water supply reliability is increasing, only a few studies have directly attempted to quantify its value. These studies indicate that residential and industrial (i.e., urban) customers seem to value supply reliability quite highly. Stated preference studies concluded that the annual value of water reliability ranged from $93 to $489 per household

(updated to 2009 dollars) for total reliability (i.e., a 0% probability of their water supply being interrupted in times of drought).

The challenge of using such information to determine the value of the Project is interpreting the survey-based household monetary values. The values noted above reflect a willingness-to-pay to ensure complete reliability (zero drought-related use restrictions in the future), whereas these integrated projects enhance only overall reliability, but do not guarantee 100% reliability. Thus, the dollar values from the studies will probably overstate the reliability value provided by the Project. One simple way to roughly adjust for this "whole versus part" problem is to attribute a portion of the total value of reliability to the portion of the project that is solved by the project.

Distribution of Project Benefits and Identification of Beneficiaries

The following table summarizes the Project's beneficiaries. This Project will lower water supply costs through water conservation that may be passed on to local ratepayers. The Project will also increase supplies available to Metropolitan Water District of Southern California (MWD) customers and mitigate declining conditions of the Bay-Delta Ecosystem through reduced water exports.

Table 7.10: Project Beneficiaries Summary

Local	Regional	Statewide
Local ratepayers	MWD customers	Bay-Delta Ecosystem

Project Benefits Timeline Description

This Project would provide water supply benefits beyond the 50-year Project lifetime (2011-2060).

Uncertainty of Benefits

Projected savings through the installation of smart irrigation controllers represent best estimates based on the latest available data. Actual water savings will vary.

Table 7.11: Omissions, Biases, and Uncertainties and their Effect on the Project

Benefit or cost category	Likely impact on net benefits*	Comment
Avoided Imported Water Cost		
• Water rate forecast	+/-	Margin of error implicit in forecasting

Economic Analysis: Water Supply

Benefit or cost category	Likely impact on net benefits*	Comment
(MWD) • Climate	+	The projections also are driven by "normal year" expectations, whereas dry year conditions will add additional cost pressures (and may move some of the imported water to higher cost Tier 2 levels).
• Regulatory/legal	+	Regulatory/ legal issues combine to make it more likely than not that the future availability of MWD-provided imported waters will be increasingly constrained, and that costs will escalate at rates higher than experienced in the recent past.
• Increased water demands	+	Other MWD users may increase their demand which may result in higher rates (holding supply constant)
Water Supply Reliability	+	The monetized value of added reliability is not included in the benefit-cost comparison. If we had added the present value benefit of improved water supply reliability in the overall benefit-cost analysis, it would increase net benefits.

* *Direction and magnitude of effects on net benefits*
- *+ Likely to increase net benefits relative to quantified estimates*
- *++ Likely to increase net benefits significantly*
- *- Likely to decrease net benefits*
- *-- Likely to decrease net benefits significantly*
- *+/- Uncertain*

The "Without Project" Baseline

If this Project is not implemented, imported potable water will continue to be purchased for purposes for which other water sources, such as recycled or reclaimed, would suffice.

Potential Adverse Effects from the Project

Any potential short-term impacts associated with Project construction will be mitigated. No long-term adverse effects are expected as a result of the proposed Project.

Project Costs

The total estimated cost for the Project is $813,320. When operations and maintenance costs through 2060 are considered, the present value in 2009 dollars is $849,234. Capital and maintenance costs will be expended in 2011 and 2012, with the largest capital cost in

construction and implementation. The operation costs are estimated to be $9,400 in 2011. Detailed cost information associated with the Project, including present value calculations is presented in Appendix 7.B.

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Project is provided in Table 7.B.1 of Appendix 7.B. The life of the Project is estimated to be 50 years. The only foreseeable cost for operations for this Project is access to the current evapotranspiration (ET) weather data, which is done through a subscription service by the manufacturer at an estimated cost of $9,400 per year.

The annual water supply benefits of implementing the Project are provided in Table 7.B.2 of Appendix 7.B. For this analysis, MWD Tier I treated rates were used for the value of the water.

The annual costs of avoided projects are provided in Table 7.B.3 of Appendix 7.B. There are no annual costs of avoided projects associated with implementation of this Project.

The annual other water supply benefits of the Project are provided in Table 7.B.4 of Appendix 7.B. There are no annual other water supply benefits associated with implementation of this Project.

The total water supply benefits for the Project are provided in Table 7.B.5 of Appendix 7.B. These benefits are provided through avoided potable water purchases and have a present value of $612,985.

IV. Storm Drain Improvements and Installation of Infiltration Chambers

Water Supply Benefits

This Project does not have any quantifiable water supply benefits. The infiltration chamber that will be installed under medians, which are also parking areas, will consist of a gravel well and a permeable layer such as a sand layer. The infiltration chambers will store up to 1,600,000 gallons (4.9 acre-feet) of stormwater for infiltration and groundwater recharge. It is estimated that 9,000,000 gallons of stormwater per year will infiltrate and indirectly replenish the groundwater basin. This groundwater recharge will reduce the amount of stormwater discharging into the Dominguez Channel. The West Coast Groundwater Basin is an adjudicated basin without additional capacity to pump groundwater, and is unable to use additional groundwater supplies to replace water imports; therefore, the Project has no water supply benefits.

Table 7.14: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Not applicable	Not applicable	Not applicable

Avoided Water Supply Purchases

Not applicable.

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. This Project provides for improved supply reliability through the infiltration of stormwater into the local groundwater basin.

Although interest in water supply reliability is increasing, only a few studies have directly attempted to quantify its value. These studies indicate that residential and industrial (i.e., urban) customers seem to value supply reliability quite highly. Stated preference studies concluded that the annual value of water reliability ranged from $93 to $489 per household (updated to 2009 dollars) for total reliability (i.e., a 0% probability of their water supply being interrupted in times of drought).

The challenge of using such information to determine the value of the Project is interpreting the survey-based household monetary values. The values noted above reflect a willingness-to-

pay to ensure complete reliability (zero drought-related use restrictions in the future), whereas these integrated projects enhance only overall reliability, but do not guarantee 100% reliability. Thus, the dollar values from the studies will probably overstate the reliability value provided by the Project. One simple way to roughly adjust for this "whole versus part" problem is to attribute a portion of the total value of reliability to the portion of the problem that is solved by the project.

Distribution of Project Benefits and Identification of Beneficiaries

Potential Adverse Effects from the Project

Any potential short-term impacts associated with Project construction will be mitigated. No long-term adverse effects are expected as a result of the proposed Project.

Project Costs

The total estimated cost for the Project is $6,161,360. When operations and maintenance costs through 2060 are considered, the present value in 2009 dollars is $10,603.033. Capital costs will be expended from 2009 to 2014, with the largest capital cost in construction and implementation. The operation and maintenance costs are estimated to be $65,000 in 2014 (Table 7.17). Additional operations costs in 2012 and 2013 represent additional personnel and oversight as well as startup costs. Detailed cost information associated with the Project, including present value calculations is presented in Appendix 7.C.

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Project is provided in Table 7.C.1 of Appendix 7.C. Operational costs will begin in 2012. Additional operations costs in 2012 and 2013 represent additional personnel and oversight as well as startup costs. Maintenance on the Project is not expected to be needed until 2013, with a larger amount planned in the beginning for the initial start-up to accommodate additional personnel.

The annual water supply benefits of implementing the Project are provided in Table 7.C.2 of Appendix 7.C. There are no water supply benefits provided by the Project since there will be no additional pumping capacity in the basin and, therefore, no replacement of imported water purchases.

The annual costs of avoided projects are provided in Table 7.C.3 of Appendix 7.C. There are no annual costs of avoided projects associated with implementation of this Project.

The annual other water supply benefits of the Project are provided in Table 7.C.4 of Appendix 7.C. There are no monetized annual other water supply benefits associated with implementation of this Project.

Economic Analysis: Water Supply

The total water supply benefits for the Project are provided in Table 7.C.5 of Appendix 7.C. There are no monetized total water supply benefits associated with implementation of this Project.

V. Penmar Water Quality Improvement and Runoff Reuse Improvement Project

Water Supply Benefits

The Project will result in the water supply benefits summarized in Table 7.20. This Project would result in water supply benefits associated with avoided water supply purchases and improved water supply reliability. The magnitude of benefits, monetized when possible, is reported in Table 7.24. Detailed cost and benefit information associated with the Project, including present value calculations, is presented in Appendix 7.D.

Table 7.20: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Avoided water import purchases	Monetized	Local / Regional / Statewide
Improved water supply reliability	Qualitative	Local and Regional

Avoided Water Supply Purchases

This Project is expected to generate water savings through avoided purchase of imported water supply. The Project will capture urban dry-weather flows and stormwater runoff generated from a 1,468-acre tributary area during storm events. This water will be stored, treated, and reused for irrigation purposes. By increasing local water supplies, the Project will reduce dependency on imported water and preserve potable water supply for uses other than irrigation.

Based on Total Maximum Daily Load (TMDL) model diversion assumptions of 0.44 cubic feet per second (cfs) dry-weather flow and 10 storms per year, and water supply estimates based on treating stormwater and dry weather flows, it is estimated the system will capture 324 acre-feet per year (AFY). To account for variability in storm weather patterns and water quality, the economic analysis took only 40% of the 324 AFY total for the water supply calculations.

Economic Analysis: Water Supply

In addition, 3.5 AFY were deducted from 324 AFY to account for the water used in the 16th Street Watershed Runoff Use Demonstration Project economic analysis. Based on these assumptions, the Project will reduce the purchase of imported water by 126 AFY. The avoided cost of water conserved has a present value benefit in 2009 dollars of approximately $1,764,283 assuming a 6% discount rate.

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. This Project will provide imported water conservation and reduce imported water demand.

Although interest in water supply reliability is increasing, only a few studies have directly attempted to quantify its value. These studies indicate that residential and industrial (i.e., urban) customers seem to value supply reliability quite highly. Stated preference studies concluded that the annual value of water reliability ranged from $93 to $489 per household (updated to 2009 dollars) for total reliability (i.e., a 0% probability of their water supply being interrupted in times of drought).

The challenge of using such information to determine the value of the Project is interpreting the survey-based household monetary values. The values noted above reflect a willingness-to-pay to ensure complete reliability (zero drought-related use restrictions in the future), whereas these integrated projects enhance only overall reliability, but do not guarantee 100% reliability. Thus, the dollar values from the studies will probably overstate the reliability value provided by the Project. One simple way to roughly adjust for this "whole versus part" problem is to attribute a portion of the total value of reliability to the portion of the project that is solved by the project.

Distribution of Project Benefits and Identification of Beneficiaries

By increasing local water supply reliability, the Project will reduce the water supply costs, lowering water rates paid by local ratepayers. The Project has the potential to benefit MWD customers through increased availability of water supplies and to mitigate the declining conditions of the Bay-Delta Ecosystem through reduced water exports.

Table 7.21: Project Beneficiaries Summary

Local	Regional	Statewide
Local water users	MWD customers	Bay-Delta Ecosystem

Economic Analysis: Water Supply

Project Benefits Timeline Description

This Project will provide water supply benefits beginning in 2013 and beyond the 50-year Project lifetime.

Uncertainty of Benefits

Projected savings through capture of dry- and wet-weather runoff flows from storm events represent best estimates based on the latest available data. Actual water savings will vary.

Table 7.22: Omissions, Biases, and Uncertainties and Their Effect on the Project

Benefit or cost category	Likely impact on net benefits*	Comment
Avoided Imported Water Cost		
• Water rate forecast (MWD)	+/-	Margin of error implicit in forecasting
• Climate	+	The projections also are driven by "normal year" expectations, whereas dry year conditions will add additional cost pressures (and may move some of the imported water to higher cost Tier 2 levels).
• Regulatory/legal	+	Regulatory/ legal issues combine to make it more likely than not that the future availability of MWD-provided imported waters will be increasingly constrained, and that costs will escalate at rates higher than experienced in the recent past.
• Increased water demands	+	Other MWD users may increase their demand which may result in higher rates (holding supply constant)
• Increased water use efficiency	-/+	If local water users increase/decrease their water efficiency, less/more dry weather runoff would be available for treatment and reuse; therefore, quantity of avoided water imports could be overstated/understated.
• Local water purveyor cost	+	MWD wholesale water rates do not include local purveyor costs, which are included in the water rates paid to LADWP by the City of Los Angeles. If these costs were included in the price of water, avoided water costs would be higher.
Water Supply Reliability	+	The monetized value of added reliability is not

Economic Analysis: Water Supply

- *++ Likely to increase net benefits significantly*
- *- Likely to decrease net benefits*
- *-- Likely to decrease net benefits significantly*
- *+/- Uncertain*

The "Without Project" Baseline

If this Project is not implemented, potable water will continue to be used for irrigation purposes when other water sources, such as recycled or reclaimed, would suffice.

Potential Adverse Effects from the Project

Any potential short-term impacts associated with Project construction will be mitigated. No long-term adverse effects are expected as a result of the proposed Project.

Project Costs

The total estimated cost for the Project is $24,581,775. When operations and maintenance costs through 2060 are considered, the present value in 2009 dollars is $27,269,735. Capital costs will be expended between 2010 and 2013, with the largest capital cost in construction and implementation. The operation and maintenance costs are estimated to be $435,400 in 2014 when both phases of the Project have been completed. Detailed cost information associated with the Project, including present value calculations is presented in Appendix 7.D.

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Project is provided in Table 7.D.1 of Appendix 7.D. The life of the Project is estimated to be 50 years. The operation and maintenance cost for the first year of operation will be $217,700, and will increase to $435,400 when Phase II is completed. The Project also assumes replacements as follows: mechanical equipment every 20 years, all filters throughout the year, some UV bulb replacements each year.

The annual water supply benefits of implementing the Project are provided in Table 7.D.2 of Appendix 7.D. For this analysis, the water quantity estimate was based on treating stormwater and dry-weather flows. The water rate used for the analysis was the MWD Tier 1 treated water rate. Based on TMDL model assumptions on diversion of 0.44 cfs dry-weather flow and 10 storms per year filling the tank, the system will capture 324 AFY. To account for variability in storm events and water quality, only 40% of 324 AFY was used for the water supply calculations.

In addition, 3.5 AFY was deducted from the calculations to account for the water that will be used by the 16th Street Watershed Runoff Use Demonstration Project benefit analysis.

The annual costs of avoided projects are provided in Table 7.D.3 of Appendix 7.D. There are no annual costs of avoided projects associated with implementation of this Project.

The annual other water supply benefits of the Project are provided in Table 7.D.4 of Appendix 7.D. There are no annual other water supply benefits associated with implementation of this Project.

The annual total water supply benefits for the Project are provided in Table 7.D.5 of Appendix 7.D. These benefits are provided through avoided potable water purchases and have a present value of $1,764,283.

VI. Model Equestrian Center Project

Water Supply Benefits

This Project will result in water supply benefits associated with avoided water supply purchases and improved water supply reliability as summarized in Table 7.25. The magnitude of benefits, monetized when possible, is reported in Table 7.29. Detailed cost and benefit information associated with the Project, including present value calculations, is presented in Appendix 7.E.

Table 7.25: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Avoided water supply purchases	Monetized	Local / Regional / Statewide
Improved water supply reliability	Qualitative	Local and Regional

Avoided Water Supply Purchases

This Project is expected to generate water savings through avoided potable water supply purchases. The new 15,000 square-foot barn and associated improvements includes key water quality features, such as rainwater harvesting, a covered horse wash area with wash water captured and re-used for dust control in arenas, and/or subsurface irrigation to maintain appearance of habitat buffers and treatment bioswales. The benefits will result in 2/3 of wash water being reused. As a result, this Project will reduce water purchases (and associated costs) by 0.6 AFY. This water would otherwise be purchased from MWD. Therefore, the avoided cost of water conserved has a present value benefit of approximately $8,368, in 2009 dollars assuming a 6% discount rate.

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. This Project provides for water conservation and reduces water demand.

Although interest in water supply reliability is increasing, only a few studies have directly attempted to quantify its value. These studies indicate that residential and industrial (i.e., urban) customers seem to value supply reliability quite highly. Stated preference studies concluded that the annual value of water reliability ranged from $93 to $489 per household

(updated to 2009 dollars) for total reliability (i.e., a 0% probability of their water supply being interrupted in times of drought).

The challenge of using such information to determine the value of the Project is interpreting the survey-based household monetary values. The values noted above reflect a willingness-to-pay to ensure complete reliability (zero drought-related use restrictions in the future), whereas these integrated projects enhance only overall reliability, but do not guarantee 100% reliability. Thus, the dollar values from the studies will probably overstate the reliability value provided by the Project. One simple way to roughly adjust for this "whole versus part" problem is to attribute a portion of the total value of reliability to the portion of the project that is solved by the project.

Distribution of Project Benefits and Identification of Beneficiaries

The following table summarizes the Project's beneficiaries. This Project will benefit the equestrian center users through lower operating costs. The Project has the potential to benefit State Water Project (SWP) customers through increased availability of supplies. It will also mitigate declining ecosystem conditions of the Bay-Delta Ecosystem through reduced water exports.

Table 7.26: Project Beneficiaries Summary

Local	Regional	Statewide
Equestrian center users	SWP customers	Bay-Delta Ecosystem

Project Benefits Timeline Description

The Project would provide benefits in excess of the 50-year project lifetime (2012-2060).

Uncertainty of Benefits

The projected savings from capturing runoff are the best estimates based on the latest available data. Actual water savings will vary.

Table 7.27: Omissions, Biases, and Uncertainties and their Effect on the Project

Benefit or cost category	Likely impact on net benefits**	Comment
Avoided Imported Water Cost • Water rate forecast (MWD)	+/-	Margin of error implicit in forecasting

Economic Analysis: Water Supply

Benefit or cost category	Likely impact on net benefits**	Comment
• Climate	+	The projections are driven by "normal year" expectations, whereas dry year conditions will add additional cost pressures (and may move some of the imported water to higher cost Tier 2 levels).
• Regulatory/legal	+	Regulatory/ legal issues combine to make it more likely than not that the future availability of MWD-provided imported waters will be increasingly constrained, and that costs will escalate at rates higher than experienced in the recent past.
• Increased water demands	+	Other SWP users may increase their demand which may result in higher rates (holding supply constant).
• Decreased equestrian center use	-	If actual capacity utilization at the equestrian center is below expected levels upon which water supply needs are estimated, then cost-savings are overstated.
• Local purveyor water costs	+	MWD wholesale water rates do not include local purveyor costs, which are included in the water rates paid by the equestrian center. If these costs were included in the price of water, avoided water costs would be higher.
Water Supply Reliability	+	The monetized value of added reliability is not included in the benefit-cost comparison. If we had added the present value benefit of improved water supply reliability in the overall benefit-cost analysis, it would increase net benefits.

The "Without Project" Baseline

If this Project is not implemented, potable water will continue to be wasted on applications where other types of water, such as reclaimed or recycled, would be sufficient.

Economic Analysis: Water Supply

Potential Adverse Effects from the Project

Any potential short-term impacts associated with project construction, such as dust or noise, will be mitigated. No long-term adverse effects are expected as a result of the proposed Project.

Project Costs

The total estimated cost for the Project over the Project timeline is $1,980,260, for a present value of $5,303,972. Capital and maintenance costs will be expended in 2011 and 2012, with the largest capital cost being construction and implementation. Operations and maintenance costs are estimated to be $252,666 in 2013. Detailed cost information associated with the Project, including present value calculations is presented in Appendix 7.E.

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Project is provided in Table 7.E.1 of Appendix 7.E. The life of the Project is estimated to be 50 years. Administration and operation costs for this Project were estimated from the 2009-2010 facility budget are by using a factor of 0.35to proportionally represent the additional costs associated with the new portion of the facility (excluding electricity and water, which are addressed in Water Quality (WQ) & other benefits sheet) plus additional annual maintenance cost of $5,000 to maintain the new retrofit areas.

The annual water supply benefits of implementing the Project are provided in Table 7.E.2 of Appendix 7.E. The water supply benefits are provided by avoiding potable water supply purchases due to wash water reuse and rainwater harvesting. For this Project, it was assumed that all rainfall runoff from the barn roof can be captured (assuming an average annual rainfall of 12 inches for the region), and that 2/3 of wash water can be reused.

The annual costs of avoided projects are provided in Table 7.E.3 of Appendix 7.E. There are no annual costs of avoided projects associated with implementation of this Project.

Economic Analysis: Water Supply

The annual other water supply benefits of the Project are provided in Table 7.E.4 of Appendix 7.E. There are no annual other water supply benefits associated with implementation of this Project.

The annual total water supply benefits for the Project are provided in Table 7.E.5 of Appendix 7.E. These benefits are provided through avoided potable water purchases and have a present value of $8,368.

VII. 16th Street Watershed Runoff Use Project

Water Supply Benefits

This Project will result in water supply benefits associated with avoided water supply purchases and improved water supply reliability (summarized in Table 7.30). The magnitude of benefits, monetized when possible, is reported in Table 7.34. Detailed cost and benefit information associated with the Project, including present value calculations, is presented in Appendix 7.F.

Table 7.30: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Avoided water supply purchases	Monetized	Local / Regional / Statewide
Improved water supply reliability	Qualitative	Local and Regional

Avoided Water Supply Purchases

This Project is expected to generate water savings through avoided use of potable water supply purchases for irrigation. The new 4,000 linear feet (LF) of pipeline connecting Marine Park to the Penmar Water Quality Improvement Project, new cistern, and new pumping system will allow for the storage and use of treated stormwater for irrigation. The Project will reduce water purchases and associated costs by the equivalent of 3.5 AFY. This water would otherwise be purchased from MWD. Therefore the avoided cost of water conserved has a present value benefit in 2009 dollars of approximately $68,612 assuming a 6% discount rate.

Economic Analysis: Water Supply

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. This Project provides for water conservation and reduces water demand.

Although interest in water supply reliability is increasing, only a few studies have directly attempted to quantify its value. The studies indicate that residential and industrial (i.e., urban) customers seem to value supply reliability quite highly. Stated preference studies found that the annual value of reliability ranged from $93 to $489 per household (updated to 2009 dollars) for total reliability (i.e., a 0% probability of their water supply being interrupted in times of drought).

The challenge of using such information to determine the value of the Project is interpreting the survey-based household monetary values. The values noted above reflect a willingness-to-pay to ensure complete reliability (zero drought-related use restrictions in the future), whereas these integrated projects enhance only overall reliability, but do not guarantee 100% reliability. Thus, the dollar values from the studies will probably overstate the reliability value provided by the Project. One simple way to roughly adjust for this "whole versus part" problem is to attribute a portion of the total value of reliability to the portion of the problem that is solved by the project.

Distribution of Project Benefits and Identification of Beneficiaries

This Project benefits the Marine Park by lowering the operating costs resulting in increased availability of funds for other Marine Park requirements (Table 7.31). The Project has the potential to benefit State Water Project (SWP) customers through increased availability of water supplies and mitigation of declining ecosystem conditions in the Bay-Delta ecosystem through reduced water exports.

Table 7.31: Project Beneficiaries Summary

Local	Regional	Statewide
Marine Park	SWP customers	Bay-Delta Ecosystem

Project Benefits Timeline Description

The Project would provide water supply benefits for 21 years (2014-2034) after the completion of Phase 1 of the Penmar Project, scheduled for 2014. Based on cost distribution over time, costs are assumed to begin in 2011 and benefits begin in 2014, both extending through 2034.

Economic Analysis: Water Supply

Uncertainty of Benefits

Projected savings by utilizing treated stormwater represent best estimates based on the latest available data (Table 7.32). Actual water savings will vary.

Table 7.32: Omissions, Biases, and Uncertainties and their Effect on the Project

Benefit or cost category	Likely impact on net benefits**	Comment
Avoided Imported Water Cost		
• Water rate forecast (MWD)	+/-	Margin of error implicit in forecasting
• Climate	+	The projections also are driven by "normal year" expectations, whereas dry year conditions will add additional cost pressures (and may move some of the imported water to higher cost Tier 2 levels).
• Regulatory/legal	+	Regulatory/ legal issues combine to make it more likely than not that the future availability of MWD-provided imported waters will be increasingly constrained, and that costs will escalate at rates higher than experienced in the recent past.
• Increased water demands	+	Other SWP users may increase their demand and may result in higher rates (holding supply constant)
Water Supply Reliability	+	The monetized value of added reliability is not included in the benefit-cost comparison. If we had added the present value benefit of improved water supply reliability in the overall benefit-cost analysis, it would increase net benefits.

** *Direction and magnitude of effects on net benefits*
- *+ Likely to increase net benefits relative to quantified estimates*
- *++ Likely to increase net benefits significantly*
- *- Likely to decrease net benefits*
- *-- Likely to decrease net benefits significantly*
- *+/- Uncertain*

The "Without Project" Baseline

If this Project is not implemented, potable water will continue to be purchased for irrigation when other water sources, such as reclaimed or recycled, would be sufficient.

Economic Analysis: Water Supply

Potential Adverse Effects from the Project

Any potential short-term impacts associated with Project construction, such as dust or noise, will be mitigated. No long-term adverse effects are expected as a result of the proposed Project.

Project Costs

The total estimated cost for the Project is $2,364,950, for a present value of $1,918,312. Capital and maintenance costs will be expended in 2011 through 2014, with the largest capital cost being construction and implementation. The maintenance costs are estimated to be $10,000 in 2014. Detailed cost information associated with the Project, including present value calculations is presented in Appendix 7.F.

++ (significant)

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Project is provided in Table 7.F.1 of Appendix 7.F. The life of the Project is estimated to be 21 years. The potable irrigation system currently exists and incurs operational and maintenance costs. Completion of the proposed Project will not result in an increase in O&M costs except for periodic inspection and maintenance of the pumps at Marine Park. Based on City maintenance staff experience, the annual maintenance costs are fairly low; however, once every three years of use, pumps typically require replacement or major repairs. Costs in Table 7.F.1 of Appendix 7.F reflect these incremental costs.

The annual water supply benefits of implementing the Project are provided in Table 7.F.2 of Appendix 7.F. The water quantity estimate is based on City of Los Angeles' treatment of only rain water, not dry weather flows. If the City of Los Angeles decides to treat dry weather flows, the water quantity estimate may increase.

The annual costs of avoided projects are provided in Table 7.F.3 of Appendix 7.F. There are no annual costs of avoided projects associated with implementation of this Project.

Economic Analysis: Water Supply

The annual other water supply benefits of the Project are provided in Table 7.F.4 of Appendix 7.F. There are no annual other water supply benefits associated with implementation of this.

The annual total water supply benefits for the Project are provided in Table 7.F.5 of Appendix 7.F. These benefits are provided through avoided potable water purchases and have a present value of $68,612.

VIII. Surface Water Treatment Plant Improvements

Water Supply Benefits

This Project will result in the water supply benefits summarized in Table 7.35. This Project will result in water supply benefits associated with avoided water supply purchases. The magnitude of benefits, monetized when possible, is reported in Table 7.39. Detailed cost and benefit information associated with the Project, including present value calculations, is presented in Appendix 7.G.

Table 7.35: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Avoided water supply purchases	Monetized	Local / Regional / Statewide

Avoided Water Supply Purchases

This Project is expected to generate water savings through avoided purchase of imported potable water supply. The Stage II Disinfection Byproducts Rule (DBP Rule) will render the Temple Water Treatment Plant (TWTP) in non-compliance and it will be forced to shut down. If the TWTP is shut down, CIC customers will be obligated to purchase Tier 1 treated water from MWD. The Project will reduce water purchases and associated costs by 7,500 AFY in 2012. Once the Stage II DBP Rule goes into effect in mid-2012 the Project will reduce water purchases and associated costs by 12,000 AFY from 2013-2060. Therefore the avoided water purchase cost of water conserved has a present value benefit in 2009 dollars of approximately $172,150,784, assuming a 6% discount rate. The avoided water purchase cost of water conserved represents the added cost to CIC customers as well as lost revenues to CIC.

Economic Analysis: Water Supply

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. This Project will reduce imported water demand.

Although interest in water supply reliability is increasing, only a few studies have directly attempted to quantify its value. These studies indicate that residential and industrial (i.e., urban) customers seem to value supply reliability quite highly. Stated preference studies concluded that the annual value of water reliability ranged from $93 to $489 per household (updated to 2009 dollars) for total reliability (i.e., a 0% probability of their water supply being interrupted in times of drought).

The challenge of using such information to determine the value of the Project is interpreting the survey-based household monetary values. The values noted above reflect a willingness-to-pay to ensure complete reliability (zero drought-related use restrictions in the future), whereas these integrated projects enhance only overall reliability, but do not guarantee 100% reliability. Thus, the dollar values from the studies will probably overstate the reliability value provided by the Project. One simple way to roughly adjust for this "whole versus part" problem is to attribute a portion of the total value of reliability to the portion of the problem that is solved by the project.

Distribution of Project Benefits and Identification of Beneficiaries

The following table summarizes the Project's beneficiaries. This Project benefits the local water purveyors that purchase CIC water supplies by not purchasing imported water from MWD, which allows lower water costs to be passed on to the customers. It also prevents CIC from experiencing loss in revenue from the cessation of treatment plant operations. The Project will also keep current supplies available to regional MWD water users and benefit the Bay-Delta Ecosystem by mitigation of declining ecosystem conditions through reduced water exports.

Table 7.36: Project Beneficiaries Summary

Local	Regional	Statewide
CIC; local water purveyors reliant on CIC supplies and their customers	MWD customers	Bay-Delta Ecosystem

Project Benefits Timeline Description

Economic Analysis: Water Supply

This Project would provide water supply benefits in excess of the 50-year Project lifetime (2012-2060).

Uncertainty of Benefits

Projected savings through treatment plant improvements represent best estimates based on the latest available data. Actual water savings will vary.

Table 7.37: Omissions, Biases, and Uncertainties and their Effect on the Project

Benefit or cost category	Likely impact on net benefits**	Comment
Avoided Imported Water Cost		
• Water rate forecast (MWD)	+/-	Margin of error implicit in forecasting
• Climate	+	The projections also are driven by "normal year" expectations, whereas dry year conditions will add additional cost pressures (and may move some of the imported water to higher cost Tier 2 levels).
• Regulatory/legal	+	Regulatory/ legal issues combine to make it more likely than not that the future availability of MWD-provided imported waters will be increasingly constrained, and that costs will escalate at rates higher than experienced in the recent past.
• Increased water demands	+	Other SWP users may increase their demand which may result in higher rates (holding supply constant)
• TWTP shutdown due to noncompliance	--	The probability of shutdown and duration of shutdown with and without the project is uncertain. However, any shutdown of TWTP would significantly decrease the net benefits.
Water Supply Reliability	++	The monetized value of added reliability is not included in the benefit-cost comparison. If we had added the present value benefit of improved water supply reliability in the overall benefit-cost analysis, it would increase net benefits significantly.

** *Direction and magnitude of effects on net benefits*

+ *Likely to increase net benefits relative to quantified estimates*

++ *Likely to increase net benefits significantly*

- *Likely to decrease net benefits*

-- *Likely to decrease net benefits significantly*

+/- *Uncertain*

Economic Analysis: Water Supply

The "Without Project" Baseline

If this Project is not implemented, more expensive imported potable water will need to be purchased or groundwater will need to be pumped.

Potential Adverse Effects from the Project

Any potential short-term impacts associated with Project construction will be mitigated. No long-term adverse effects are expected as a result of the proposed Project.

Project Costs

The total estimated cost for the Project is $6,811,784. When operations and maintenance costs through 2060 are considered, the present value in 2009 dollars is $10,660,636. Capital and maintenance costs will be expended between 2011 and 2013, with the largest capital cost in construction and implementation. The operation and maintenance costs are estimated to be $268,628 in 2011. Detailed cost information associated with the Project, including present value calculations is presented in Table 7.G.1 of Appendix 7.G.

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Project is provided in Table 7.G.1 of Appendix 7.G. The life of the Project is estimated to be 50 years. The values used for this analysis were derived from the Project's Preliminary Design Report (see Appendix x-x for Preliminary Design Report).

Economic Analysis: Water Supply

The annual water supply benefits of implementing the Project are provided in Table 7.G.2 of Appendix 7.G. For this analysis, MWD Tier I treated rates were used for the value of the water.

The annual costs of avoided projects are provided in Table 7.G.3 of Appendix 7.G. There are no annual costs of avoided projects associated with implementation of this Project.

The annual other water supply benefits of the project are provided in Table 7.G.4 of Appendix 7.G. There are no annual other water supply benefits associated with implementation of this Project.

The total water supply benefits for the Project are provided in Table 7.G.5 of Appendix 7.G. These benefits are provided through avoided potable water purchases and have a present value of $172,150,784.

IX. Central Los Angeles County Regional Water Recycling Program

Water Supply Benefits

This Project is composed of two components: the Griffith Park South Water Recycling Project (Griffith Park Project) and the Groundwater Replenishment Facilities Planning Study (GWR Study). The Project will result in water supply benefits associated with avoided water supply purchases, and improve water supply reliability (summarized in Table 7.40). The magnitude of benefits, monetized when possible, is reported in Table 7.44. Detailed cost and benefit information associated with the Project, including present value calculations, is presented in Appendix 7.H.

Table 7.40: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Avoided water supply purchases (Griffith Park South Recycled Water Distribution System)	Monetized	Local / Regional / Statewide
Potential avoided water supply purchases (Groundwater Replenishment into Raymond Basin)	Physical Quantification	Local / Regional / Statewide
Improved water supply reliability	Qualitative	Local / Regional / Statewide

Economic Analysis: Water Supply

Avoided Water Supply Purchases

The Griffith Park Project is expected to generate water savings through avoided purchase of imported water supply from the Metropolitan Water District of Southern California (MWD). This will be achieved through the construction of the required components for transferring recycled water to the 9-hole Roosevelt Municipal Golf Course, including a facility and related infrastructure. The Griffith Park Project will reduce non-potable water purchases and associated costs by 450 acre-feet per year (AFY). The Roosevelt Municipal Golf Course receives MWD Tier 1 untreated water 50 weeks of the year; therefore, the avoided water purchase costs are based on MWD wholesale rates for Tier 1 untreated water. The projected average cost in 2009 dollars of Tier 1 untreated MWD water during the Griffith Park Project lifetime, from 2014 to 2060, is $852/AF The resulting average annual cost savings are projected to be $383,400 (before discounting). Therefore the avoided water purchase costs of water conserved has a present value benefit in 2009 dollars of approximately $4,231,326, assuming a 6% discount rate.

The GWR Study component of the Project will determine the feasibility of recharging up to 2,700 AFY of water into the Raymond Basin. This analysis does not monetize the avoided water purchase costs that would be expected to result.

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. This Project reduces the demand for water from the State Water Project (SWP) by shifting to local supply. This will benefit California residents and State and local government agencies involved in water management in preparing for drought years by reducing the uncertainty of demand for water supplies.

Other SWP users will benefit from increased supply reliability including, but not limited to, other Southern California municipal water users that depend on the availability of supplies from MWD. Studies have shown municipal water users throughout California are willing to pay in order to avoid water shortages and reduce water scarcity[2]. Jenkins et al (2001) estimated that

[2] Jenkins et al (2001) used programming methods to measure the per capita value of urban water scarcity by Detailed Analysis Unit (DAU) throughout California at projected population levels in the year 2020. The results show estimated scarcity values ranging between $5 and $20 per person in the Los Angeles region DAUs (in 1995 dollars). Scarcity values are measured as lost consumer surplus resulting from changes in quantity of water available for a given willingness-to-pay schedule and depend heavily on the estimated price elasticity of demand for urban water supplies.

Economic Analysis: Water Supply

LA area residents would be willing to pay between $5 and $20, in 1995 dollars, per person on average, at projected 2020 population levels, to avoid costs associated with water scarcity. Expressed in 2009 dollar values[3], these willingness-to-pay estimates range from $7 to $29 per person.

Project specific benefits for improved water supply reliability are not monetized for the purpose of the benefits calculation. An application of per capita scarcity values estimated by Jenkins et al (2001) were computed based on projected 2020 population levels, and therefore cannot be applied annually over the life of the Project.

The Project does not create an additional 450 AFY of water supplies, but shifts supply sources from regional (SWP) water to local sources (recycled water). As a result, quantifying residents' incremental willingness-to-pay to avoid water scarcity requires a probabilistic analysis to determine the relative improvement in supply reliability between the Project and without project sources. Such a study is outside the scope of this analysis.

Distribution of Project Benefits and Identification of Beneficiaries

The Project will benefit the City of Los Angeles through reduced water costs as well as the owners and patrons of Roosevelt Municipal Golf Course when these cost savings are realized and passed on in the form of reduced green fees (prices) for all users. Regionally, the Project will increase the availability of water supplies, improve water supply reliability and avoid effects of subsidence through potential future replenishment of the Raymond Basin benefits to both SWP and Raymond Basin users.

Statewide, this Project mitigates the declining conditions of the Bay-Delta Ecosystem through reduced water exports. The Project will shift to a local recycled water supply, which will benefit the State through more effective drought management and reduced demand for SWP water. A summary of beneficiaries is presented in Table 7.41.

Table 7.41: Project Beneficiaries Summary

Local	Regional	Statewide
City of Los Angeles and/or Patrons of Roosevelt Municipal Golf Course	SWP Customers; Residents of the Region	Bay-Delta Ecosystem, California Residents, California Water Regulatory and Management Agencies

Project Benefits Timeline Description

[3] Based on the Consumer Price Index for all urban consumers in the Los Angeles-Riverside-Orange County Metropolitan Statistical Area (MSA)

Economic Analysis: Water Supply

The Griffith Park Project will provide water supply benefits beginning in excess of the 46-year Project lifetime (2014-2060).

Uncertainty of Benefits

Projected savings from replacing imported water supply with recycled water represent best estimates based on the latest available data. Actual water savings will vary.

Table 7.42: Omissions, Biases, and Uncertainties and their Effect on the Project

Benefit or cost category	Likely impact on net benefits*	Comment
Avoided Imported Water Cost		
• Climate	+	Projected MWD water rates are driven by "normal year" expectations, whereas dry year conditions will add additional cost pressures (and may move some of the imported water to higher cost Tier 2 levels). Increasing effects of climate change, specifically with respect to global warming, may increase evaporation and evapotranspiration resulting in reduced water supplies and possibly higher water prices (holding demand constant). The future price of MWD water maybe understated as a result, and thus net benefits would likely increase.
• MWD Tier 1 Rate Assumption	-	The MWD Tier 1 untreated water price was used to quantify the avoided cost of imported water. Roosevelt Municipal Golf Course has historically purchased MWD Tier 2 untreated water, which is priced higher than MWD Tier 1 untreated water. Use of the MWD Tier 1 rate reduces net benefits.
• Regulatory/legal	+	Recent regulatory/ legal issues, specifically those surrounding the Bay-Delta ecosystem with respect to operation of the SWP, increase the likelihood that MWD surface water supplies will be reduced in the future even at existing demand levels. As a result, rates may increase at higher rates than experienced in the recent past.
• Increased water demands	+/-	Other SWP users may increase their demand, which may result in higher rates (holding supply constant). Population projections are forecasted based on a host of assumptions that, if incorrect, will result in uncertainty about actual future demand for California water.
• Expected Benefits for GWR Project	--	The cost of the Groundwater Replenishment Facilities Planning Study (GWR Study) is included in the initial Project costs, but the expected benefit

Economic Analysis: Water Supply

Benefit or cost category	Likely impact on net benefits*	Comment
		resulting from the Project, specifically the reduction in 2,700 AFY of non-potable imported water purchases, is not monetized. This omission may act to reduce overall net benefits, assuming the initial Project cost and O&M of the groundwater replenishment activities at the Raymond Basin are not greater than the monetized value of avoided imported water purchases.
Water Supply Reliability	+	The monetized value of added reliability is not included in the benefit-cost comparison. Adding the present value benefit of improved water into the overall benefit-cost analysis would increase net benefits.

** Direction and magnitude of effects on net benefits*

- *+ Likely to increase net benefits relative to quantified estimates*
- *++ Likely to increase net benefits significantly*
- *- Likely to decrease net benefits*
- *-- Likely to decrease net benefits significantly*
- *+/- Uncertain*

The "Without Project" Baseline

If this Project is not implemented, imported water will continue to be used for irrigation of the Roosevelt Municipal Golf Course and the GWR Study will not be conducted to determine the feasibility of storing up to 2,700 AFY of recycled water from the Los Angeles-Glendale Water Reclamation Plant (LAGWRP).

Potential Adverse Effects from the Project

Any potential short-term impacts associated with Project construction will be mitigated. No long-term adverse effects are expected as a result of the proposed Project.

Project Costs

The total estimated cost for the Project is $10,289,247. When operations and maintenance costs through 2060 are considered, the present value in 2009 dollars is $11,383,746. Capital and maintenance costs will be expended in 2010 through 2013, with the largest capital cost in construction and implementation. The operation and maintenance costs are estimated to be $191,800 in 2014. Detailed cost information associated with the Project, including present value calculations is presented in Appendix 7.H.

** *Magnitude of effect on net benefits* *+/- (negligible or unknown)* *+ (moderate)* *++ (significant)*	

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Project is provided in Table 7.H.1 of Appendix 7.H. The lifetime of the Project is estimated to exceed 47 years. Operation and Maintenance costs for this analysis were obtained from LADWP Water Operation's staff from a similar Pump Station and Tank (details of the cost breakdowns are provided in Table 7.H.1 of Appendix 7.H).

The annual water supply benefits of implementing the Project are provided in Table 7.H.2 of Appendix 7.H. For this analysis, the avoided cost to purchase MWD Tier 2 untreated water makes up about 2.3% of LADWP's water supply (12,590 AFY of 547,000 AFY total supply). The Roosevelt Municipal Golf Course receives untreated MWD water for all but 2 weeks each year when it purchases treated water. The water supply benefits are not expected to begin until 2014.

The annual costs of avoided projects are provided in Table 7.H.3 of Appendix 7.H. There are no annual costs of avoided projects associated with implementation of this Project.

The annual other water supply benefits of the Project are provided in Table 7.H.4 of Appendix 7.H. There are no annual other water supply benefits associated with implementation of this Project.

The total water supply benefits for the Project are provided in Table 7.H.5 of Appendix 7.H. These benefits are provided through avoided potable water purchases and have a present value of $4,231,326.

X. Tujunga Spreading Grounds Enhancement

Water Supply Benefits

This Project will result in water supply benefits associated with avoided water supply purchases and improved water supply reliability (Table 7.45). The magnitude of benefits, monetized when possible, is reported in Table 7.49. Detailed cost and benefit information associated with the Project, including present value calculations, is presented in Appendix 7.I.

Table 7.45: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Avoided water supply purchases	Monetized	Local / Regional / Statewide
Improved water supply reliability	Qualitative	Local and Regional

Avoided Water Supply Purchases

This Project will generate water savings through avoided purchase of imported water supply. The Project will increase the capacity of the spreading grounds from 8,000 acre-feet per year (AFY) to 16,000 AFY, allowing for an increase of 8,000 AFY on average in the amount of stormwater captured and available for groundwater recharge. As a result, the Project will reduce costs by decreasing imported water purchases by approximately 8,000 AFY. Therefore these avoided costs due to water conservation over the life of the Project, from 2013 to 2060, have a present value benefit in 2009 dollars of approximately $78,771,729, assuming a 6% discount rate.

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. This Project reduces imported water demand by increasing stormwater infiltration into the groundwater basin.

Although interest in water supply reliability is increasing, only a few studies have directly attempted to quantify its value. These studies indicate that residential and industrial (i.e., urban) customers seem to value supply reliability quite highly. Stated preference studies concluded that the annual value of water reliability ranged from $93 to $489 per household

(updated to 2009 dollars) for total reliability (i.e., a 0% probability of their water supply being interrupted in times of drought).

The challenge of using such information to determine the value of the Project is interpreting the survey-based household monetary values. The values noted above reflect a willingness-to-pay to ensure complete reliability (zero drought-related use restrictions in the future), whereas these integrated projects enhance only overall reliability, but do not guarantee 100% reliability. Thus, the dollar values from the studies will probably overstate the reliability value provided by the Project. One simple way to roughly adjust for this "whole versus part" problem is to attribute a portion of the total value of reliability to the portion of the project that is solved by the project.

Distribution of Project Benefits and Identification of Beneficiaries

This Project will reduce the water supply costs which will lower the water rates paid by local customers. The Project will also increase supplies available to the Metropolitan Water District of Southern California (MWD) customers and mitigate the declining conditions of the Bay-Delta Ecosystem through reduced water exports.

Table 7.46: Project Beneficiaries Summary

Local	Regional	Statewide
Local Water Customers	MWD Customers	Bay-Delta Ecosystem

Project Benefits Timeline Description

This Project will provide water supply benefits beginning in 2013 and continuing beyond the 50-year Project lifetime.

Uncertainty of Benefits

Projected savings through capture of stormwater represent best estimates based on the latest available data. Actual water savings will vary.

-- Likely to decrease net benefits significantly

+/- Uncertain

The "Without Project" Baseline

If this Project is not implemented, the spreading grounds will not be expanded and the recharge capacity rate will not be increased to allow an additional 8,000 AFY of stormwater to infiltrate the groundwater basin. Therefore, 8,000 AFY of imported potable water will continue to be purchased which could be used for other water sources.

Potential Adverse Effects from the Project

Any potential short-term impacts associated with Project construction will be mitigated. No long-term adverse effects are expected as a result of the proposed Project.

Economic Analysis: Water Supply

Project Costs

The total estimated cost for the Project is $25,304,121. When operations and maintenance costs through 2060 are considered, the present value in 2009 dollars is $24,939,968. Capital and maintenance costs will be expended in 2013 and 2014, with the largest capital cost in construction and implementation. The operation and maintenance costs are estimated to be $253,517 in 2013. Detailed cost information associated with the Project, including present value calculations is presented in Appendix 7.I.

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Project is provided in Table 7.I.1 of Appendix 7.I. The life of the Project is estimated to be 50 years. The current operations and maintenance agreement between LADWP and LACFCD (Agreement #10400) stipulates that the LACFCD will maintain and operate the spreading basin at no cost to LADWP. However, due to the proposed improvements to the facility, a new operation and maintenance agreement will be issued to address the added scope and dimension of the Project. Future O&M cost will be discussed with the LACFCD, as the proposed operator, once designs have been completed.

The annual water supply benefits of implementing the Project are provided in Table 7.I.2 of Appendix 7.I. For this analysis, the cost reflects the value of purchased MWD untreated water at Tier 1 rates. The additional captured volume of 8,000 AFY is not expected to deviate significantly over the 50-year life of the Project.

Economic Analysis: Water Supply

The annual costs of avoided projects are provided in Table 7.I.3 of Appendix 7.I. There are no annual costs of avoided projects associated with implementation of this Project.

The annual other water supply benefits of the Project are provided in Table 7.I.4 of Appendix 7.I. There are no annual other water supply benefits associated with implementation of this Project.

The total water supply benefits for the Project are provided in Table 7.I.5 of Appendix 7.I. These benefits are provided through avoided potable water purchases and have a present value of $78,771,729.

XI. San Antonio Spreading Grounds Improvements

Water Supply Benefits

This Project will result in water supply benefits associated with avoided water supply purchases, specifically reduced purchase of treated imported water through the spreading of untreated imported water at the San Antonio Spreading Grounds (summarized in Table 7.50). The water stored in the local aquifer through this process will allow for greater local supply reliability. The magnitude of benefits, monetized when possible, is reported in Table 7.54. Detailed cost and benefit information associated with the Project, including present value calculations, are presented in Appendix 7.J.

Table 7.50: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Decreased water supply costs	Monetized	Local / Regional
Improved water supply reliability	Qualitative	Local / Regional

Avoided Water Supply Purchases

This Project is expected to reduce water purchase costs based on the differential between MWD wholesale rates for Tier 1 treated and untreated water, which are expected to escalate over time. These savings have a present value benefit in 2009 dollars of approximately $36,937,911, assuming a 6% discount rate. It is assumed that 8,250 AF of MWD surplus water will be available each year throughout the Project life. The benefit analysis only considers water the completed facility would be able to deliver to the San Antonio Spreading Grounds.

Economic Analysis: Water Supply

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. This Project provides for improved supply reliability through the storage of untreated imported water into the local groundwater basin.

Although interest in water supply reliability is increasing, only a few studies have directly attempted to quantify its value. These studies indicate that residential and industrial (i.e., urban) customers seem to value supply reliability quite highly. Stated preference studies concluded that the annual value of water reliability ranged from $93 to $489 per household (updated to 2009 dollars) for total reliability (i.e., a 0% probability of their water supply being interrupted in times of drought).

The challenge of using such information to determine the value of the Project is interpreting the survey-based household monetary values. The values noted above reflect a willingness-to-pay to ensure complete reliability (zero drought-related use restrictions in the future), whereas these integrated projects enhance only overall reliability, but do not guarantee 100% reliability. Thus, the dollar values from the studies will probably overstate the reliability value provided by the Project. One simple way to roughly adjust for this "whole versus part" problem is to attribute a portion of the total value of reliability to the portion of the problem that is solved by the project.

Distribution of Project Benefits and Identification of Beneficiaries

This Project will benefit the local San Gabriel Valley water users by reducing imported water costs and increasing water supply reliability (Table 7.51). Additional spreading capacity reduces the overall water cost of recharge water, with cost savings passed on to local customers through water rates.

Table 7.51: Project Beneficiaries Summary

The "Without Project" Baseline

If this Project is not implemented, the region will not be able to recharge the excess untreated MWD water of up to 8,250 AFY in the San Antonio Spreading Grounds.

Potential Adverse Effects from the Project

Any potential short-term impacts associated with Project construction will be mitigated. No long-term adverse effects are expected as a result of the proposed Project.

Project Costs

The total estimated cost for the Project is $4,999,800. When operations and maintenance costs through 2060 are considered, the present value in 2009 dollars is $4,279,286. Capital costs will be expended in 2011 through 2013, with the largest capital cost in construction and implementation. The operation and maintenance costs are estimated to be $11,088 in 2011. Detailed cost information associated with the Project, including present value calculations is presented in Appendix x-2.

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Project is provided in Table 7.J.1 of Appendix 7.J. The life of the Project is estimated to be 50 years. The values used for this analysis were derived from the Project's Preliminary Design Report (see Appendix J.3 for Preliminary Design Report).

The annual water supply benefits of implementing the Project are provided in Table 7.J.2 of Appendix 7.J. For this analysis, MWD Tier I treated rates and MWD untreated rates were used for the value of the water.

The annual costs of avoided projects are provided in Table 7.J.3 of Appendix 7.J. There are no annual costs of avoided projects associated with implementation of this Project. The annual other water supply benefits of the Project are provided in Table 7.J.4 of Appendix 7.J. There are no annual other water supply benefits associated with implementation of this Project.

The annual total water supply benefits for the Project are provided in Table 7.J.5 of Appendix 7.J. These benefits are provided through avoided potable water purchases and have a present value of $36,937,911.

XII. Leo J Vander Lans Advanced Treatment Plant Expansion

Water Supply Benefits

This Project will result in water supply benefits associated with avoided water supply purchases, specifically through the injection of highly treated recycled water into the groundwater basin (Table 7.55). The water stored in the local aquifer through this process will allow for greater local supply reliability. The magnitude of benefits, monetized when possible, is reported in Table x.5. Detailed cost and benefit information associated with the Project, including present value calculations, is presented in Appendix 7.K.

Economic Analysis: Water Supply

Table 7.55: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Avoided water supply purchases	Monetized	Local / Regional / Statewide
Improved water supply reliability	Qualitative	Local / Regional

Avoided Water Supply Purchases

This Project is expected to reduce water purchase costs based on the differential between MWD wholesale rates for Tier 1 treated and untreated water, which are expected to escalate over time. These savings have a present value benefit in 2009 dollars of approximately $45,285,312, assuming a 6% discount rate. It is assumed that 4,000 AFY of MWD water will be available each year throughout the Project life. The benefit analysis only considers water the completed facility will be able to deliver.

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. This Project improves supply reliability through water storage and recharge into the groundwater basin.

Although interest in water supply reliability is increasing, only a few studies have directly attempted to quantify its value. These studies indicate that residential and industrial (i.e., urban) customers seem to value supply reliability quite highly. Stated preference studies concluded that the annual value of water reliability ranged from $93 to $489 per household (updated to 2009 dollars) for total reliability (i.e., a 0% probability of their water supply being interrupted in times of drought).

The challenge of using such information to determine the value of the Project is interpreting the survey-based household monetary values. The values noted above reflect a willingness-to-pay to ensure complete reliability (zero drought-related use restrictions in the future), whereas these integrated projects enhance only overall reliability, but do not guarantee 100% reliability. Thus, the dollar values from the studies will probably overstate the reliability value provided by the Project. One simple way to roughly adjust for this “whole versus part” problem is to attribute a portion of the total value of reliability to the portion of the problem that is solved by the project.

Economic Analysis: Water Supply

Distribution of Project Benefits and Identification of Beneficiaries

The following table (Table 7.56) summarizes the Project's beneficiaries.

This Project will benefit the local water users by reducing imported water cost and increasing water supply reliability. The Project will also keep current supplies available to regional MWD water users and mitigate the declining ecosystem conditions of the Bay-Delta Ecosystem through reduced water exports.

Table 7.56: Project Beneficiaries Summary

Local	Regional	Statewide
Local water customers	MWD customers	Bay-Delta Ecosystem

Project Benefits Timeline Description

This Project would provide water supply benefits for 30 years (2014-2043).

Uncertainty of Benefits

Projected savings through recharge of untreated imported water represent best estimates based on the latest available data. Actual water savings will vary.

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Project is provided in Table 7.K.1 of Appendix 7.K. The life of the Project is estimated to be 30 years.

The annual water supply benefits of implementing the Project are provided in Table 7.K.2 of Appendix 7.K. For this analysis, MWD Tier I treated rates and MWD untreated rates were used for the value of the water.

The annual costs of avoided projects are provided in Table 7.K.3 of Appendix 7.K. There are no annual costs of avoided projects associated with implementation of this Project.

The annual other water supply benefits of the Project are provided in Table 7.K.4 of Appendix 7.K. There are no annual other water supply benefits associated with implementation of this Project.

The total water supply benefits for the Project are provided in Table 7.K.5 of Appendix 7.K. These benefits are provided through avoided potable water purchases and have a present value of $45,285,312.

XIII. Whittier Narrows Conservation Pool Project

Water Supply Benefits

The Project will result in water supply benefits associated with avoided water supply purchases, specifically reduced purchase of imported water for spreading (summarized in Table 7.60). The water stored through this Project would allow for recharge of the local aquifer that will provide greater local water supply reliability. The magnitude of benefits, monetized when possible, is reported in Table 7.64. Detailed cost and benefit information associated with the Project, including present value calculations, is presented in Appendix 7.L.

Economic Analysis: Water Supply

Table 7.60: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Avoided water supply purchases	Monetized	Local / Regional / Statewide
Improved water supply reliability	Qualitative	Local / Regional / Statewide

Avoided Water Supply Purchases

The Water Replenishment District of Southern California (WRD) is charged with spreading and injecting water into the ground to maintain sufficient supplies of high-quality groundwater in the Central Basin, one of many basins in the Los Angeles area. Historically, this has been accomplished by capturing storm water and snow-melt, as well as purchasing untreated replenishment water supplies from the Metropolitan Water District of Southern California (MWD). The Project will develop a new, sustainable and drought-resistant supply for groundwater recharge into the Central Basin. Specifically, the maximum pool level behind Whittier Narrows Dam (Dam) will be increased from 201.6-ft to 205-ft, equivalent to an additional conservation pool volume of 1,200 AF.

The increase in storage capacity at the Dam is expected to capture 1,100 AFY of storm water, which will recharge the Central Basin via the Rio Hondo and San Gabriel Coastal Spreading Grounds behind the Dam. This potential supply produced by the Project accounts for approximately 5% of WRD's anticipated imported water purchases for spreading during 2010-2011 (WRD 2010 Engineering Survey and Report, Tables 1 and 7). The WRD expects this potential supply to replace annual purchases of replenishment and untreated Tier 1 water from MWD by 1,100 AFY between 2015 and 2060. Avoided cost of imported water purchases is quantified using projected annual water rates for MWD untreated Tier 1 water. Reduced WRD cost for groundwater recharge may lower its assessment, a potential benefit to local and regional residents.

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. The Project does not create additional water supplies, but shifts supply sources from regional (SWP) water to local surface water. As a result, quantifying residents' incremental willingness-to-pay to avoid water scarcity requires a probabilistic analysis to determine the relative improvement in

supply reliability between the Project and without project sources. Such a study is outside the scope of this analysis.

Reducing the demand for water from the SWP by using more local supply will benefit California residents and state and local government agencies involved in water management in preparing for drought years by reducing uncertainty about demand for SWP supplies. Other SWP users will benefit from increased supply reliability, including, but not limited to, other Southern California municipal water users depending on the availability of supplies from MWD. Studies have shown municipal water users throughout California are willing to pay in order to avoid water shortages and reduce water scarcity.

Although interest in water supply reliability is increasing, only a few studies have directly attempted to quantify its value. These studies indicate that residential and industrial (i.e., urban) customers seem to value supply reliability quite highly. Stated preference studies concluded that the annual value of water reliability ranged from $93 to $489 per household (updated to 2009 dollars) for total reliability (i.e., a 0% probability of their water supply being interrupted in times of drought).

The challenge of using such information to determine the value of the Project is interpreting the survey-based household monetary values. The values noted above reflect a willingness-to-pay to ensure complete reliability (zero drought-related use restrictions in the future), whereas these integrated projects enhance only overall reliability, but do not guarantee 100% reliability. Thus, the dollar values from the studies will probably overstate the reliability value provided by the Project. One simple way to roughly adjust for this "whole versus part" problem is to attribute a portion of the total value of reliability to the portion of the project that is solved by the project.

Distribution of Project Benefits and Identification of Beneficiaries

The Project will benefit regional SWP customers through increased availability of supplies (Table x.2). Residents of the region will benefit from overall increases in water supply reliability. WRD will reduce its reliance on MWD water supplies for replenishment and increase the probability of meeting its objective of maintaining ample groundwater supplies. Reductions in WRD's operating costs will reduce the assessment it levies and local and regional citizens will benefit.

On a statewide level, reducing imported water purchased will allow California government agencies to more effectively manage future statewide droughts because the Los Angeles region has increased use of local surface water and reduced its demand for SWP water. California citizens also benefit as water rationing (in drought years) will be less likely.

Economic Analysis: Water Supply

Table 7.61: Project Beneficiaries Summary

Local	Regional	Statewide
WRD Customers and Local Residents	SWP Customers; Residents of the Region	California Residents, California Water Regulatory and Management Agencies

Project Benefits Timeline Description

This Project will provide water supply benefits in excess of the 50-year Project lifetime (2011-2060).

Uncertainty of Benefits

Projected savings associated with using local surface water for recharge as opposed to imported water represent best estimates based on the latest available data. Actual water savings will vary.

Table 7.62: Omissions, Biases, and Uncertainties and their Effect on the Project

Benefit or cost category	Likely impact on net benefits*	Comment
Avoided Imported Water Cost		
• Climate	+/-	Projected MWD water rates are driven by "normal year" expectations, whereas dry year conditions will add additional cost pressures (and may move some of the imported water to higher cost Tier 2 levels). Increasing effects of climate change, specifically with respect to global warming, may increase evaporation and evapotranspiration resulting in reduced water supplies and possibly higher water prices (holding demand constant). The future price of MWD water maybe understated as a result, and thus net benefits would likely increase. If climate change reduces average local rainfall, the amount of storm water the Project can capture and use to recharge the basin may be reduced, thus partially offsetting avoided water purchases.
• MWD Replenishment Rate Assumption	+	According to WRD's 2010 Engineering Survey and Report, surplus replenishment water supplies from MWD have been increasingly unavailable and the trend is expected to continue. As a result, the WRD expects that it will have to purchase untreated Tier 1

Economic Analysis: Water Supply

Benefit or cost category	Likely impact on net benefits*	Comment
		water for spreading during 2010-2011. Untreated Tier 1 water is priced approximately 30% higher than untreated replenishment water available from MWD. This acts to understate net benefits.
• Regulatory/legal	+	Recent regulatory/ legal issues, specifically those surrounding the Bay-Delta ecosystem with respect to operation of the SWP, increase the likelihood that MWD surface water supplies will be reduced in the future even at existing demand levels. As a result, rates may increase at higher rates than experienced in the recent past.
• Increased water demands	+/-	Other SWP users may increase their demand, which may result in higher rates (holding supply constant). Population projections are forecasted based on a host of assumptions that, if incorrect, will result in uncertainty about actual future demand for California water.
Water Supply Reliability	+	The monetized value of added reliability is not included in the benefit-cost comparison. Adding the present value benefit of improved water reliability into the overall benefit-cost analysis would increase net benefits.

** Direction and magnitude of effects on net benefits*

+ Likely to increase net benefits relative to quantified estimates
++ Likely to increase net benefits significantly
- Likely to decrease net benefits
-- Likely to decrease net benefits significantly
+/- Uncertain

The "Without Project" Baseline

If this Project is not implemented, 1,100 AFY of imported water will continue to be purchased for groundwater recharge.

Potential Adverse Effects from the Project

Any potential short-term impacts associated with Project implementation will be mitigated. No long-term adverse effects are expected as a result of the proposed Project.

Project Costs

The total estimated cost for the Project is $1,701,505. When operations and maintenance costs through 2060 are considered, the present in 2009 dollars is $4,412,611. Capital costs will be

expended in 2011 through 2014. The operation and maintenance costs are estimated to be $257,200 in 2015. Detailed cost information associated with the Project, including present value calculations, is presented in Appendix 7.L. Operational costs include the cost of a dam tender when water is held behind the dam and additional operational costs at the adjacent reclamation plant during storm events. Maintenance costs include clean-up costs for inundation area. Other costs include recreational costs (loss of use) and environmental mitigation (biological mitigation and monitoring and wildlife monitoring).

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Project is provided in Table 7.x.6 of Appendix x.2. The life of the Project is estimated to be 50 years. The values used for this analysis were derived from the 2000 Los Angeles County Drainage Area (LACDA) Water Conservation and Supply Santa Fe – Whittier Narrows Dams Feasibility Study (Feasibility Study) (see Appendix x-x for Feasibility Study).

The annual water supply benefits of implementing the Project are provided in Table 7.L.1 of Appendix 7.L. For this analysis, MWD replenishment rates were used for the value of the water.

The annual costs of avoided projects are provided in Table 7.L.2 of Appendix 7.L. There are no annual costs of avoided projects associated with implementation of this Project.

The annual other water supply benefits of the Project are provided in Table 7.L.3 of Appendix 7.L. There are no annual other water supply benefits associated with implementation of this Project.

Economic Analysis: Water Supply

The total water supply benefits for the Project are provided in Table 7.L.4 of Appendix 7.L. These benefits are provided through avoided potable water purchases and have a present value of $7,781,351.

XIV. Water and Energy Efficiency in the School and Hotel/Motel Sectors

Water Supply Benefits

The Program will result in water supply benefits associated with avoided water supply purchases and improve water supply reliability (Table 7.65). The magnitude of benefits, monetized when possible, is reported in Table 7.69. Detailed cost and benefit information associated with the Program, including present value calculations, is presented in Appendix 7.M.

Table 7.65: Benefits Summary

Type of Benefit	Assessment Level	Beneficiaries
Avoided Cost of Imported Water	Monetized	Local/Regional/Statewide
Improved Water Supply Reliability	Qualitative	Local/Regional

Avoided Cost of Imported Water

The Program is expected to generate water savings through avoided purchase of imported water supply. This Project will conserve an estimated 85 acre-feet per year (AFY). This total is based on the estimated savings per device. Full water supply benefits will begin in 2012 and extend through 2030, at which point the first devices are at the end of their useful life and the water supply benefits will proportionally decline until 2060. The avoided purchase costs of water conserved through 2060 has a present value benefit in 2009 dollars of approximately $1,028,177 assuming a 6% discount rate.

Improved Water Supply Reliability

The reliability of a water supply refers to the ability to meet water demands on a consistent basis, even in times of drought or other constraints on source water availability. This Program provides for imported water conservation and reduces imported water demand.

Economic Analysis: Water Supply

Although interest in water supply reliability is increasing, only a few studies have directly attempted to quantify its value. These studies indicate that residential and industrial (i.e., urban) customers seem to value supply reliability quite highly. Stated preference studies concluded that the annual value of water reliability ranged from $93 to $489 per household (updated to 2009 dollars) for total reliability (i.e., a 0% probability of their water supply being interrupted in times of drought).

The challenge of using such information to determine the value of the Program is interpreting the survey-based household monetary values. The values noted above reflect a willingness-to-pay to ensure complete reliability (zero drought-related use restrictions in the future), whereas these integrated projects enhance only overall reliability, but do not guarantee 100% reliability. Thus, the dollar values from the studies will probably overstate the reliability value provided by the Program. One simple way to roughly adjust for this "whole versus part" problem is to attribute a portion of the total value of reliability to the portion of the project that is solved by the project.

Distribution of Project Benefits and Identification of Beneficiaries

The Program will reduce water and energy use and expenses, making funds available for other requirements (Table 7.66). The Program will increase supplies available to MWD customers. It will also improve the quality of the beaches as the leachate will not travel to the ocean. by reducing septic system leachate flows in the Project area. This Program will mitigate the declining conditions of the Bay-Delta Ecosystem through reduced water exports.

Table 7.66: Project Beneficiaries Summary

Local	Regional	Statewide
Schools and Hotels/Motels, Local Visitors to Area Beaches	SWP Customers, Regional Visitors to Area Beaches	Bay Delta Ecosystem, Statewide Visitors to Area Beaches

Project Benefits Timeline Description

This Program will provide water supply benefits beginning in 2012. Full water supply benefits begin in 2012 and extend through 2030, when the first devices installed reach the end of their life. After 2030, the water supply benefits will proportionally decline until 2060.

Uncertainty of Benefits

Projected savings through the installation of smart irrigation controllers represent best estimates based on the latest available data (Table 7.67). Actual water savings will vary.

Economic Analysis: Water Supply

Table 7.67: Omissions, Biases, and Uncertainties and their Effect on the Project

Benefit or cost category	Likely impact on net benefits*	Comment
Water Supply (Avoided Water Costs)		
• Water rate forecast (MWD)	+/-	Margin of error implicit in forecasting
• Climate	+	The projections also are driven by "normal year" expectations, whereas dry year conditions will add additional cost pressures (and may move some of the imported water to higher cost Tier 2 levels).
• Regulatory/legal	+	Regulatory/ legal issues combine to make it more likely than not that the future availability of MWD-provided imported waters will be increasingly constrained, and that costs will escalate at rates higher than experienced in the recent past.
• Increased water demands	+	Other MWD users may increase their demand which may result in higher rates (holding supply constant)
• Schools, hotels, and motels may not participate fully in program	-	As a voluntary program, if schools, hotels and motels do not participate, the benefits would be overstated
Water Supply Reliability	+	The monetized value of added reliability is not included in the benefit-cost comparison. If we had added the present value benefit of improved water supply reliability in the overall benefit-cost analysis, it would increase net benefits.

* *Direction and magnitude of effects on net benefits*
- *+ Likely to increase net benefits relative to quantified estimates*
- *++ Likely to increase net benefits significantly*
- *- Likely to decrease net benefits*
- *-- Likely to decrease net benefits significantly*
- *+/- Uncertain*

Economic Analysis: Water Supply

The "Without Project" Baseline

If this Program is not implemented, imported potable water will continue to be used at the current rates and water savings will not be realized.

Potential Adverse Effects from the Project

No potentially adverse effects are anticipated from this Program.

Project Costs

The total estimated cost for the Program is $566,100. Since there is no administration, operations, maintenance, or replacement costs for this Program, the initial Program cost alone has a present value in 2009 dollars of $475,660. Capital costs will be expended from 2011 through 2013, with the largest capital cost being Program implementation (Table 7.68). Detailed cost information associated with the Program, including present value calculations, is presented in Appendix 7.M.

Economic Analysis: Water Supply

Methods used to Estimate With- and Without-Project Conditions

The annual cost of implementation of the Program is provided in Table 7.M.1 of Appendix 7.M. The life of the Program is estimated to be 50 years.

The annual water supply benefits of implementing the Program are provided in Table 7.M.2 of Appendix 7.M. For this analysis, MWD Tier I treated rates were used for the value of the water.

The annual costs of avoided projects are provided in Table 7.M.3 of Appendix 7.M. There are no annual costs of avoided projects associated with implementation of this Program.

The annual other water supply benefits of the Program are provided in Table 7.M.4 of Appendix 7.M. There are no annual other water supply benefits associated with implementation of this Program.

The total water supply benefits for the Program are provided in Table 7.M.5 of Appendix 7.M. These benefits are provided through avoided potable water purchases and have a present value of $1,028,177.

Total Present Value of Discounted Benefits over Project Life (Monetized Benefits):	$50,567,382
Project Allocation:	100.0%
Total Present Value of Discounted Benefits (Monetized Benefits):	**$50,567,382**

	Narrative description of benefits: (1) Pooling of water in Basin is not currently possible due to innundation of So Cal Edison power poles, therefore no benefit without this project. (2) If the Raymond Basin Management Board allowed water agencies to pump, the value of this water would be $2.5 million dollars per year. The 4,300 acre feet per year benefit is based on an average rainfall year.	Narrative description of benefits: Imported water costs minus aquifer pumping costs of Canyon wate. The Canyon component will increase water diversion capcity and result in an increase in available groundwater supplies from 2,775 AFY to 3,650 AFY,thereby reduiciong water imports	Narrative description of benefits:

Project Life								**Total Present Value of Discounted Costs (Sum of Column (i))**							
								Transfer to Table 20, Column (c), Exhibit F: Proposal Costs and Benefit Summaries	**$849,234**						

Comments: The only foreseeable maintenance cost with this project is access to the current ET weather data. This is done through a subscription service by the manufacture at an estimated cost of $9,400 per year. This service plan is sold at a discounted rate for $47,000 for 5 years

Project Life							Total Present Value of Discounted Costs (Sum of Column (i))		
							Transfer to Table 20, Column (c), Exhibit F: Proposal Costs and Benefit Summaries		**$10,603,033**

Comments:
The $125,000 in 2011 is large as it is the initial effort which will require more personal & administrative oversight. This will cover the years 2011 through 2013.
Operational costs will not begin until 2012, with a larger amount planned in the beginning for the initial start-up.
Maintenance on the project is not expected to be needed until 2013, with a larger amount planned in the beginning for the initial start-up.

Project Life									
								Total Present Value of Discounted Costs (Sum of Column (i))	
								Transfer to Table 20, Column (c), Exhibit F: Proposal Costs and Benefit Summaries	**$27,269,735**

Comments: *O&M Cost is the avaerage ($435,400/yr) of the range of ($290,300/yr to $580,500/yr) from the conceptual report. The costs in the first year are expected to be lower as the treatment system will not be completely operational. Project assumes Replacement as follows: Mechanical Equipment every 20 years, all filters will be replaced throught the year and some UV bulb replacements each year. Note the first year of O&M cost is reduced by 50% because it is only Phase 1.*

Project Allocation:	100.0%
Total Present Value of Discounted Benefits (Monetized Benefits):	**$1,764,283**

Narrative description of benefits: *potable water supply is preserved for use other than irrigation*	**Narrative description of benefits:**	**Narrative description of benefits:**

Comments: *Assume lifespan through 2060 for the project. Water quantity estimate based on treating rain water and dry weather flows. Water rate is MWD Teir 1 Rate ($701). Based TMDL model assumprtions on diversion assumptions of 0.44 cfs dry weather flow and 10 storms per year filling the tank, the system would capture 324 AF/year however to account for variability in storm weather pattern and water quality we will only count 40% of the for the water supply calculations. We will also deduct 3.5 AFY to account for the water the is used in Santa Monica's Benefit analysis (1523 HCF/year ~ 3.5 AFY)*

	Total Present Value of Discounted Costs (Sum of Column (i))													
Project Life	Transfer to Table 20, Column (c), Exhibit F: Proposal Costs and Benefit Summaries								**$3,581,185**					

Comments: *Administration and operation costs from 2009-10 facility bidget scaled by factor of 0.35 to represent new portion of facility (excluding electricity and water which are addressed in WQ & other benefits sheet) plus additional annual maintenance cost of $5,000 to maintain retrofit areas. Life of project estimated to be 50 years.*

							Total Present Value of Discounted Costs (Sum of Column (i))							
Project Life							**Transfer to Table 20, Column (c), Exhibit F: Proposal Costs and Benefit Summaries**		**$ 1,922,824**					

Comments: Irrigation system currently exists and incurs operational and maintenance costs. Completion of the proposed project will not result in an increase in O&M costs except for periodic inspection and maintenance of the pumps at Penmar Recreation Center and at Marine Park. Costs above reflect incremental costs. Based on City maintenance staff experience, annual maintenance costs are fairly low, however on the 3rd year of use, pumps typically require replacement or major repairs.

Project Life								Total Present Value of Discounted Costs (Sum of Column (i)) Transfer to Table 20, Column (c), Exhibit F: Proposal Costs and Benefit Summaries	**$ 11,383,795.74**

Comments: We requested O&M costs from LADWP Water Operation's staff for similar Pump Station and Tank, and they provided the following info: PS=$175k/yr O&M with O=80% and M=20% Tank=$60k/yr O&M with O=20% yearly and M=80% every 20 years ($60k*0.20*20) on year 20 and 40. Pipeline=$4,800/yr M ($0.60/LF). The admin costs are rolled into the O&M costs. Based on this data, annual operation costs total $152,000, while annual maintenance costs total $39,800, except for the 20th and 40th years of the project when maintenance costs total $999,800. Annual O&M costs were converted to nominal dollars using the GDP Implicit Price Deflator. Initial costs were allocted annually based on the project desription contained in Attachment 3 and supporting materials contained in"LADWP CeLAC Budget 11-1-2010.xls" and "CeLAC Schedule.mpp". It was assumed that initial costs were reported in constant 2009 dollars given instructions regarding O&M costs were to report them in constant 2009 dollars.

Total Present Value of Discounted Benefits over Project Life (Monetized Benefits):	$4,231,326
Project Allocation:	100.0%
Total Present Value of Discounted Benefits (Monetized Benefits):	**$4,231,326**

	Narrative description of benefits: *Avoided cost to purchase MWD tier 2 untreated water, which makes up about 2.3% of LADWP's water supply (12,590AFY of 547,000AFY Total Supply). Golf course receives untreated MWD water for all but 2 weeks when treated wated is purchased. Recycled water will be transported to Roosevelt Golf Course beginning 2014.*	Narrative description of benefits:	Narrative description of benefits:

Project Life							Total Present Value of Discounted Costs (Sum of Column (i))		
							Transfer to Table 20, Column (c), Exhibit F: Proposal Costs and Benefit Summaries		**$24,939,968**

Comments: *Currently the standing Operations and Maintenance agreement between LADWP and LACFCD (Agreement #10400) stipulates that the County will maintain and operate the spreading basin at no cost to LADWP. However, due to the proposed improvements to the facility, a new Operation and Maintenance agreement will be issued to address the added scope and dimension to the project. Future O&M cost have not been discussed with the County (proposed operator) since the designs have not been completed*

Total Present Value of Discounted Benefits over Project Life (Monetized Benefits):	$78,771,729
Project Allocation:	100.0%
Total Present Value of Discounted Benefits (Monetized Benefits):	**$78,771,729**

Comments: *The increase amount of stormwater capture will average 8,000 AF per year. The capture volume is not excepted to deviate much from the average for the life of the project (50 years). It is assumed that higher than average wet seasons will cancel the dryer than average seasons.*

								Total Present Value of Discounted Costs (Sum of Column (i))	
Project Life								Transfer to Table 20, Column (c), Exhibit F: Proposal Costs and Benefit Summaries	**$4,279,286**

Comments: *Based on the 2005 Feasibility Study's Annual Operating Cost, Table 8-5 & 8-6. Costs were further extrapolated based on % length the previous (4,771-LF, 45% of total estimated costs) spreading pipelines are to each other. Administration, Operation & Maintenance were estimated to be 10%, 60.3%, & 29.7% of total annual costs. See O&M workesheet.*

Total Present Value of Discounted Benefits over Project Life (Monetized Benefits):	$32,306,146
Project Allocation:	100.0%
Total Present Value of Discounted Benefits (Monetized Benefits):	**$32,306,146**

	Narrative description of benefits: *Costs will be the difference between using Met Tier 1 treated water and Met Untreated.*	**Narrative description of benefits:**	**Narrative description of benefits:**

Comments: *this table is based on an estimated 15,000-AFY, the pipeline would spread when fully constructed and operational. 55% is the proportion allocated to the northern (this proposed project) alignment, and the 45% allocated to the southern (already completed and operational) alignment. This table only considers water benefit / supply the completed facility would be able to deliver to the San Antonio Spreading Grounds. These benefits / costs are based upon 2009 dollars to purchase or sell the water. The "Value" column is the price differential between purchasing treated (Tier 1 & 2) water, to purchasing untreated water, spreading & extracting it. These references to the "Narrative" column 2009 & 2010: based on water supplied from existing pipeline. 2011 to 2060: based on estimated water supply spread after proposed facilities are completed & operating.*

Project Life								Total Present Value of Discounted Costs (Sum of Column (i))	
								Transfer to Table 20, Column (c), Exhibit F: Proposal Costs and Benefit Summaries	**$ 4,412,611**

Comments: *Based on economic analysis in preliminary impact study (2009). Operation cost includes dam tender when water is held behind dam, and additional operational costs at reclamation plant during storm events. Maintenance cost includes clean-up costs for inundation area. Other costs include recreational costs (loss of use) and environmental mitigation (biological mitigation and monitoring, wildlife monitoring).*

								Total Present Value of Discounted Costs (Sum of Column (i))	
Project Life								Transfer to Table 20, Column (c), Exhibit F: Proposal Costs and Benefit Summaries	**$475,660**

Comments: *These devices that will be installed do not require costs to maintain or operate. If a device has faulty equipment, and requires replacement of a part or entire devices and it is not covered by the manufacturer's warranty, then the reciever of the device will pay for the replacement costs. The high-efficiency toilets and urinals are expected to have a functioning lifetime of 20 years or more; the Weather-Based Irrigation Controller is expected to have a functioning lifetime of 10 years; the showerheas and aerators have an expected functioning lifetime of 2 years; and the compact florescent light bulbs have an expected functioning lifetime of 10 years. These are estimates that are used and will vary depending on how much use each device will have.*

Total Present Value of Discounted Benefits over Project Life (Monetized Benefits):	$1,028,177
Project Allocation:	100.0%
Total Present Value of Discounted Benefits (Monetized Benefits):	**$1,028,177**

Narrative description of benefits: *This project will conserve an estimated 82 acre-feet per year. This total is based on the estimated savings per device. Assumes proportional decline in water supply benefits annually after 2030. Assume treated Tier 1 water is used currently.*

Narrative description of benefits:

APPENDIX N

Estimating the Future Avoided Import Water Supply Costs of Developing Local Supplies in the Great Los Angeles County Region

Appendix 7-N:

Estimating the Future Avoided Import Water Supply Costs of Developing Local Supplies in the Great Los Angeles County Region

Introduction

Increased water produced locally within the Metropolitan Water District of Southern California (MWD) service area through conservation, recycling, groundwater recharge, groundwater extraction, and other sources will reduce the demand for imported water by the Los Angeles Region. MWD member agencies will substitute locally produced water supplies for imported water from MWD, assuming the locally produced water is less expensive than imported water. The value of adding new local supplies to satisfy local demand in place of imported water can thus be estimated based on the avoided cost of purchasing imported water.

The cost savings arising from reducing demands for imported water should be estimated based on the projected future cost of imports, at the margin. This in turn requires a projection of the cost of providing additional imported water at the levels needed in the future if local resources are not expanded in accordance with the Greater Los Angeles County Region IRWM Implementation Grant Proposal. The key empirical question for valuation is thus, "What is the future cost, at the margin, of acquiring another acre-foot (AF) of imported water, and having it delivered (and treated, where applicable) to the users of the local supply alternatives?"[1]

There are several empirical and conceptual challenges to forecasting the future avoided cost of import water. This Appendix discusses these issues and how they were addressed to develop the avoided water supply costs that are used to evaluate the benefits of those projects that provide local water (or conserve water) in the Los Angeles region.

MWD Wholesale Water Supplies and Current Prices

Water Supply

The Metropolitan Water District of Southern California (MWD) is the major municipal and industrial water wholesaler in the southern California region. With 26 member agencies serving

[1] Cost of treatment and delivery need to be included in the avoided import water costs, to provide a suitable "apples-to-apples" comparison of import water costs to the local supplies. This is because the costs used in these analyses for local supplies are generally inclusive of treatment and delivery.

approximately 19 million people 6,023 acre feet of water each day, MWD projects it will sell 1.75 million AF during 2010-2011.[2]

MWD sources water from a combination of local and imported sources. Imported sources include water diverted from the Colorado River via the Colorado River Aqueduct, from the San Francisco Bay Delta region via the State Water Project (SWP) and from the Owens Valley/Mono Basin via the Los Angeles Aqueduct (LAA). Imported water accounted for approximately 55 percent of the MWD's water supply between 2006 and 2008, of which approximately 93 percent was sourced from the Colorado River Aqueduct (50 percent) and SWP (43 percent).[3] Local sources, which include recycled water, surface water and ground water, fed largely by the San Gabriel, Santa Ana, and Los Angeles River systems, accounted for the remaining 45 percent of the MWD's water supply between 2006 and 2008. Groundwater sources make up the vast majority, or approximately 90 percent, of natural local water supplies. Recycled water and recovered groundwater are the MWD's fastest growing new sources of local water; between 2005 and 2009, the use of recycled water nearly doubled, and groundwater recovery increased from approximately 70 thousand AFY to nearly 100 thousand AFY.

Current Water Rates

MWD sells both untreated and treated water to its member agencies. As the name suggests, untreated water is raw and has not been processed to meet minimum standards acceptable for human consumption.[4] Treated water has been treated and meets federal drinking water standards.[5] Treated water is more expensive than untreated water because of the additional inputs required for its production. The current treated water surcharge for MWD (effective January 1, 2011) is $ 217per AF. Treatment costs have increased to that level from $82 per AF in calendar year 2003.[6]

MWD has established a two-tier rate structure intended to provide both assurances of needed supplies and encouragement for the local development of water resources by member agencies. Tier 1 water rates reflect the cost MWD incurs to maintain a consistent and reliable water supply for its customers. Tier 2 water rates reflect the costs MWD incurs to develop additional water supplies to meet customer demand, which are set higher than Tier 1 rates in order to encourage efficient use of local supplies. MWD also utilizes discounted rate for surplus

water supplies from within the MWD system that can be used to replenishing local supply sources.

Both treated and untreated full service Tiered volumetric water rates are function of volumetric charges ($ per AF) relating to maintaining, pumping, and delivering water to member agencies. For Tier 1 MWD water, these price components are $101, $154, and $119 per AF respectively, effective January 1, 2011. Additional volumetric charges for full service Tier 1 MWD water include a Delta surcharge ($69 per AF) reflecting pumping restrictions on the State Water Project, and a stewardship charge ($41 per AG) reflecting maintenance and development of local water supplies. These price components total $484 per AF as the full service volumetric charge for untreated Tier 1 MWD water effective January 1, 2011. After adding the treatment surcharge of $217, the full service volumetric charge for treated Tier 1 MWD water is $701 per AF. Untreated and treated replenishment water rates are computed as discounts off of the tiered water rates.

In addition to the variable charges described above, MWD water rates include fixed charges. Fixed charges are those which are primarily invariant with water volume and include, across all MWD water sources, system capacity and readiness-to serve charges. Readiness-to-Serve (RTS) charges are fixed charges associated with the portion of the MWD supply system maintained on as needed basis, while the Capacity charge recovers the cost of delivering water within the MWD system at peak usage periods. Effective January 1, 2011, the MWD RTS charge will total $114 million while the Capacity charge will total approximately $10 per AF.[7]

Projected Future Water Rates

Many factors affecting supply and demand for MWD water have caused wide differences between projected and actual water rates over the last several years. Court decisions beginning in 2007 severely impacted Sacramento-San Joaquin Delta exports and reduced dramatically the availability of SWP water to MWD. Concurrently, court decisions and several years of drought have reduced the availability of Colorado River water, historically also a major source of MWD water. These factors have affected the available supply of MWD at all price levels. Additional factors affecting the supply side include changes in the costs of productive inputs such as labor, power, and chemicals for water treatment. Factors affecting the demand for MWD water include conservation efforts, efficient technologies, and the availability of substitute water supply sources, among others.

[7] $7,200 per ft^3/s, where $1ft^3/s$. = 724.4473 AF/Year.

Drought, legal rulings, and basic supply and demand will continue to have important, but at present unknown, impacts on water availability and prices in the future, making both short-term and long-term projections subject to errors characteristic of the forecasting process.

Table 7.N.1 compares Tier 1 water rate projections published by MWD for 2005-2009 with actual water rates to illustrate differences in forecasted and actual water rates. As Table 7.N.2 shows, the margin of error associated with the forecast increases with period of time for which rates are forecast. This analysis requires MWD water rates be forecast through 2060 to match the length of time over which benefits of reduced demand for imported water accrue.

Table 7.N.1: Comparison of Projected and Actual MWD Tier 1 Water Rates

Year	Projected		Actual		Difference[a]	
	Untreated	Treated	Untreated	Treated	Untreated	Treated
2005	$331	$443	$331	$443	0.0%	0.0%
2006	$335	$460	$331	$453	-1.2%	-1.5%
2007	$345	$476	$331	$478	-3.9%	0.4%
2008	$361	$497	$351	$508	-2.6%	2.3%
2009	$379	$523	$436	$620	15.0%	18.7%

Metropolitan Water District of Southern California Website, "Water Rates and Charges", Available at: http://www.mwdh2o.com/mwdh2o/pages/finance/finance_02.html

Notes: All dollar values are nominal. Projected Tier 1 MWD water rates are sourced with 2004/05 Long Range Finance Plan, whereas actual MWD Tier 1 water rates are sourced with "Water Rates and Charges" available at the MWD website. Projected MWD Tier 1 water rates are computed as the midpoint of the low and high projected rates.

[a] (Actual - Projected) ÷ Projected

The appropriate unit price for valuing avoided costs of imported water purchases depends upon the type of local supply developed, and in turn, the type of water that would have been used in its place under the no project alternative. It was assumed that increases in water produced locally within the Los Angeles region through conservation, desalination, surface water improvements, water reclamation, and groundwater recharge will replace purchases of MWD water at the full service Tier 1 rate. Application of the treated or untreated full service Tier 1

rate depends on the specifics of each local water supply project.[8] Projects improving or creating local replenishment sources are assumed to replace purchases of MWD water at the untreated replenishment water rate.

MWD full service treated and untreated Tier 1 and untreated replenishment water rates are projected beginning with calendar year 2011. Actual MWD full service Tier 1 and replenishment water rates effective January 1, 2009, September 1, 2009 and January 1, 2010 are used for 2009-2010.[9] Water rates published by MWD as effective January 1, 2011 and January 1, 2012 are used for 2011-2012. Rates projected for 2013-2060 are based on projected year-over-year percentage changes in MWD water rates as reported at the July 2010 MWD Member Agency Manager Meeting on the Long Range Finance Plan. A 6% year-over-year percentage change is used to forecast MWD rates for 2013-2020, while a 3% annual change is used to forecast MWD rates for 2021-2060.[10] These annual percentage changes are nominal percentage changes, because they include the effect of inflation on water rates, and projected MWD full service Tier 1 and untreated replenishment water rates are nominal as a result.

The resulting nominal MWD water rates projected for each year 2009–2060 are deflated to real 2009 dollar values using the Consumer Price Index (all items) for All Urban Consumers (CPI-U) in the Los Angeles-Riverside County-Orange County Metropolitan Statistical Area, for which the actual value was used for 2009 and projected values were used for 2010-2060.[11] Annual nominal water rates were deflated to 2009 dollar values by the following formula:

$$\text{Real Water Rate}_t = \text{Nominal Water Rate}_t \div (\text{CPI-U}_t \div \text{CPI-U}_{2009})$$

Table 7.N.2 reports the projected real MWD full service Tier 1 and untreated replenishment water rates used to measure the avoided cost of imported water purchase in this analysis. Annual year-over-year percentage changes in the real water rates are also reported in the final three columns of Table 7.N.2.

[8] To the extent future water use under the no project alternative is supplied by local Tier 2 water rather than imported Tier 1 water, the total value of avoided water import costs presented in this analysis will be understated by the price differential between full service Tier 2 and Tier 1 MWD rates.

[9] Calendar year 2009 water rates were computed as the weighted average of rates effective January-August and September-December.

[10] These percentages are used to forecast untreated and treated Tier 1 and untreated replenishment rates.

[11] For the 2009, the actual value of the CPI-U for the Los Angeles area was utilized. Values for 2010-2020 were projected based on Congressional Budget Office projections for annual changes in the national CPI-U for 2010-2020. In other words, the CPI-U in Los Angeles was assumed to change at the same rate as the CPI-U for the entire nation. For 2021-2060, CPI-U values for the Los Angeles were projected at the average annual percentage change in the national CPI-U for 2012-2014 (1.7%) and 2015-2020 (2.3%).
