STORMWATER POLLUTION CONTROL REQUIREMENTS FOR SEWER CONSTRUCTION:

Eroded sediments and other pollutants must be removed on site and may not be transported from the site via street flow, wind, or other means. Erosion control measures shall be installed and maintained throughout the construction period.

Slopes of earth and other construction related materials must be protected from being washed away from the site by the force of wind or water.

Fuels, oils, solvents and other toxic materials must be stored in accordance with their labeling and are not to contaminate the soil and surface waters. All approved storage containers are to be protected from the weather. Spills must be cleaned up immediately and disposed of in a proper manner. Oils may not be washed into the drainage system.

Excess or waste concrete may not be washed into the public way or any other drainage system. Provisions shall be made to retain concrete wastes on site until they can be disposed of as solid waste.

Trash and construction related solid wastes must be deposited into a covered receptacle to prevent contamination of rainwater and dispersed by wind.

Sediments and other pollutants may not be tracked from the site by vehicles. The construction entrance roadway must be stabilized so as to inhibit sediments from being deposited into the public way. Accidental deposits must be swept up immediately and may not be washed down by rain or other means.

Any slopes with disturbed soil or denuded of vegetation must be stabilized so as to inhibit erosion by wind and water.

INFILTRATION AND LEAKAGE TESTS: Method used for existing flow is 300 gallons per day (gpd) per inch of diameter (1 inch of 100' length) or 250 gallons per day (gpd) per inch of diameter (1 inch of 100' length).
