

Memorandum

To: Christine Medak, USFWS
Project: Devil's Gate Reservoir Restoration Project
From: Lauren Simpson
Date: August 12, 2020

Subject: Weekly Least Bell's Vireo Survey and Noise Monitoring Summary for the Devil's Gate Reservoir Restoration Project; Week of August 3 – August 7, 2020

This memorandum has been prepared to summarize the results of the breeding season focused surveys for least Bell's vireo (*Vireo bellii pusillus*), nest monitoring, and noise monitoring activities conducted by ECORP Consulting, Inc. (ECORP) for Los Angeles County Public Works' (LACPW) Devil's Gate Reservoir Restoration Project (Project) in the City of Pasadena, Los Angeles County, California. The focused breeding season surveys, nest monitoring, and noise monitoring for least Bell's vireo were conducted to comply with Conservation Measure 11b of the USFWS Informal Section 7 Consultation that was issued for the Project which states:

"Noise buffer: Construction noise levels will be restricted to below 60 dBA Leq hourly at 100 feet from areas occupied by the vireo. Twice weekly surveys for the vireo will be conducted by the biological monitor in areas of suitable habitat within 500 feet of proposed construction activities to determine the presence of vireo nest building activities, egg incubation activities, or brood rearing activities. If vireos are present, noise monitoring will be conducted weekly and must demonstrate that noise levels are less than 60 dBA Leq hourly at specified monitoring locations, no less than 100 feet from the active nest(s) as determined by the biological monitor. Weekly survey reports will be prepared during the nesting season and sent electronically to the CFWO each week that vireos are detected. The weekly reports will identify the location of vireo nest sites and territories within 500 feet of the project."

A summary of least Bell's vireo survey efforts and observations of least Bell's vireo prior to the start of Project activities on May 20, 2020 was provided in the previously transmitted memo covering the period of May, 2020.

A brief summary of the Project activities, focused least Bell's vireo survey and nest monitoring results for the week of August 3, 2020 is provided below. A figure depicting the least Bell's vireo nesting location and territory within 500 feet of the Project site as well as least Bell's vireo observations outside of the territory is included as an attachment.

Project Activities – Week of August 3, 2020

Sediment Removal Activities

Project activities related to sediment removal activities continued during the week of August 3, 2020. All Project activities were monitored by a Designated Biologist. Project activities related to sediment removal activities included the following:

- Sediment removal hauling activities. Sediment removal and hauling activities included the loading of sediment within the Project site into bottom-dump haul trucks using excavators.
- Mowing and removal of emergent vegetation within the reservoir.

Restoration Activities

On-site restoration activities were ongoing during the week of August 3, 2020 and included the removal of non-native vegetation from on-site restoration areas using hand tools. Per ECORP's email communication with USFWS on July 15, 2020, restoration activities resumed within the 300-foot buffer of the previously active least Bell's vireo nest location on July 17, 2020 and continued during the week of August 3, 2020. Restoration activities were limited to hand pulling of weeds by a crew of no more than five workers under the supervision of a Designated Biologist. Restoration activities are occurring at the outermost edges of the buffer as to reduce any temporary disturbances to foraging vireo in the area.

Least Bell's Vireo Surveys – Week of August 3, 2020

Focused Least Bell's Vireo Surveys

Two focused least Bell's vireo surveys were conducted during the week of August 3, 2020. The two surveys, which occurred on August 4 and August 7, 2020, were conducted as focused breeding season surveys, to be continued twice-weekly for the duration of the least Bell's vireo breeding season (through September 15). Each survey was conducted by a CDFW- and USFWS-approved Designated Biologist for least Bell's vireo surveys. The dates and personnel for each survey are presented in Table 1.

Date	Surveyor
08/04/20	Jill Coumoutso
08/07/20	Shannan Shaffer

The least Bell's vireos were documented during surveys conducted during the week of August 3, 2020. The location of the least Bell's vireo previously active nest and territory are depicted in Attachment A. During the survey conducted on August 4, 2020, the Designated Biologist observed the male singing at the western end of the previously documented territory. During the survey conducted on August 7, 2020, the least Bell's

vireos were not observed and the male was not heard singing. During restoration monitoring a single least Bell's vireo male was observed by the restoration monitor singing within the previously documented territory on August 5 and August 7, 2020. The observation on August 7 was of a foraging least Bell's vireo singing a broken unpolished song, which indicates that it may be a juvenile of the family group. The female was not observed during the surveys conducted during the week of August 3, 2020. Although the complete family group was not observed during surveys conducted during the week of August 3, it is possible that the group continues to be present at the Project site but with reduced activity due to the progression of the season. No additional signs of nesting have been observed. These observations combined with the timing of the surveys likely indicate that the pair has completed breeding activities for the season. Per ECORP's email communication with USFWS on July 15, 2020, restoration activities have resumed within the 300-foot buffer, with limitations described above. The limitations on restoration activities within the buffer will remain in place until the Designated Biologist confirms that the vireo family group have left the Project site for the season. No sediment hauling activities will occur within the buffer.

No other observations of least Bell's vireo were documented elsewhere on the Project site during focused surveys conducted the week of August 3, 2020.

Least Bell's Vireo Noise Monitoring

The vireo family group are now mobile within the Project site and no hourly Leq levels at or above 60 dBa have been recorded at the noise monitoring location to date. Sediment hauling activities are currently taking place well outside of the vireo territory and buffer. Per ECORP's email communication with USFWS on July 15, 2020, noise monitoring activities have been stopped until sediment hauling activities return closer to the occupied habitat than was previously monitored, assuming that the vireos are still occupying the Project site at that point.
