RE:

Groundwater Level Monitoring Results
Adventure Park Stormwater Capture Project
10130 Gunn Avenue, Whittier, California

INTRODUCTION

At request of Los Angeles County Department of Public Works, Tetra Tech monitored groundwater levels from the existing monitoring wells at Adventure Park located at 10130 Gunn Avenue in Whittier, Los Angeles County, California (the Site) from November 2020 to December 2021. Site location is shown in Figure 1. The purpose of the groundwater level monitoring is to assess long-term groundwater level fluctuations and trends at the Site to support the excavation dewatering planning for the proposed construction of an underground stormwater capture facility at the Site.

Preliminary results of the Site groundwater level monitoring was provided in the report titled, *Groundwater Investigation Report and Excavation Dewatering Strategy, Adventure Park Stormwater Capture Project, 10130 Gunn Avenue, Whittier, Los Angeles County, California, January 28, 2022*, prepared by Tetra Tech (the 2022 Tetra Tech groundwater investigation report). The Tetra Tech 2022 groundwater investigation report included groundwater level data collected up to and including November 2021. This Technical Memorandum presents a summary of the site activities and results of the groundwater level monitoring including the additional groundwater level data collected in December 2021.

SITE ACTIVITIES

Tetra Tech monitored groundwater levels from a total of 5 monitoring wells at the Site on a monthly basis. The water levels were measured manually by electronic water level meter. Monitoring well locations are shown in Figure 2. Two monitoring wells, Tt-1/EW-1 and Tt-2/MW-1 which were installed in November 2020, were monitored from November 2020 to December 2021. Three additional monitoring wells MW-2, MW-3, and EW-3 were installed in October 2021 and monitored from October 2021 to December 2021. The monitoring wells were installed with well screen placed between 20 feet and 50 feet below ground surface (bgs) to intercept the sand layer at the base of the proposed excavation.

Details of the monitoring well installations are provided in *Engineering Memorandum No. 1, Rev 2. Adventure Park Monitoring and Extraction Well Installation and Development, Whittier, California, April 29, 2021* and in the 2022 Tetra Tech groundwater investigation report referenced above. Monitoring well construction details are provided in well construction logs in Appendix A. Tt-1/EW-1 and Tt-2/MW-1 were constructed identically.

On October 20, 2021, a California-licensed Tetra Tech surveyor surveyed the top of the monitoring wells for elevation and coordinates. The survey coordinates are based on California Coordinate System of 1983, Zone 5, North American Datum (NAD) 83 and Los Angeles Department of Public Works benchmark BM 0Y8220 for elevation. The surveyed coordinates and elevations and survey benchmark information are provided in Appendix B. The elevation data were used for evaluating groundwater level data.

RESULTS

The groundwater level data are summarized in Table 1. For reference, the base of the proposed underground stormwater capture structure is 114 feet above mean sea level (AMSL). The results of the groundwater level monitoring are summarized below.

- Average water level in Site monitoring well in December 2021 was 26.2 feet bgs or 114.18 feet AMSL.
- The highest water level in Site monitoring wells from November 2020 to December 2021 was 27.7 feet bgs or 116.84 feet AMSL.
- The lowest water level in Site monitoring wells from November 2020 to December 2021 was 24.1 feet bgs or 114.06 feet AMSL.
- The apparent direction of groundwater flow at the Site was to the west towards Sorensen Drain as expected (Figure 2).
- Groundwater level changes in the monitoring wells at the Site over time are shown in Figure 3. Groundwater level decreased approximately 1 foot during the monitoring period.

For the purpose of evaluating the potential groundwater level fluctuations and trends for a longer term, historical groundwater level data for Water Replenishment District of Southern California (WRD) monitoring well Whittier #1, located approximately 2 miles east of the Site, was obtained from WRD database. Monitoring well construction details are provided in well construction logs in Appendix A. Whittier #1 Zone 5 is the shallowest well screened approximately 200-220 feet bgs and the water level was at approximately 22.5 feet bgs in December 2021. Historical groundwater level data from Whittier #1 Zone 5 monitoring well since 2011 and the Site monitoring wells are shown in Figure 4. Historical groundwater level trend based on Whittier #1 Zone 5 and Site monitoring well groundwater levels are presented below.

- As shown in the hydrograph Figure 4, the Whittier #1 Zone 5 water level parallels the Site monitoring well water levels indicating that the Whittier #1 water level trend would be analogous to that of the Site monitoring wells. This indicates that the Site monitoring wells are screened in the same water-bearing zone as Whittier #1 Zone 5.
- Whittier #1 Zone 5 five-year (2016 – 2021) high and low water levels are 20.4 feet bgs (June 2020) and 24 feet bgs (December 2016), respectively, a range of 3.6 feet.
- Site monitoring well water level in September 2021 was 26.7 feet bgs. Based on the water level changes that occurred in Whittier #1 Zone 5, the five-year high and low groundwater levels at Site monitoring wells are estimated to be 25 and 28.6 feet bgs (113 to 118 feet AMSL). Therefore, in the short term the groundwater level change at the Site is expected to be no more than approximately 2 feet higher or lower from the current groundwater level at the Site, based on the five-year data.
- Seasonally, Whittier #1 Zone 5 groundwater levels fluctuated up to 3 feet in a year. The highest seasonal groundwater levels occurred generally during March to June and the lowest occurred during September to December (Figure 4). Therefore, construction during September to December is expected to require less dewatering than any other time of the year.

CONCLUSION

The conclusion derived from this groundwater level monitoring technical memorandum is consistent with that of the 2022 Tetra Tech groundwater investigation report. Based on historical groundwater levels in WRD Whittier #1 Zone 5 monitoring well, used as an index well, the five-year high and low groundwater levels at Site monitoring wells are estimated to be approximately 25 and 28.6 feet bgs (113 to 118 feet AMSL), which is no more than 2 feet higher or lower than the current groundwater levels. Additionally, based on the five-year data of the index well, groundwater levels are expected to fluctuate up to 3 feet seasonally within a year. The highest seasonal groundwater levels occur generally during March to June and the lowest groundwater level occur during September to December. Therefore, construction during September to December is expected to require less dewatering than any other time of the year. It should be noted that these estimates are to be used for planning purposes only, and the actual future water levels may vary depending on future weather conditions.

CLOSURE

We appreciate the opportunity to assist Watearth and the Los Angeles County with this phase of the Adventure Park Stormwater Capture Project. If you have any questions, please feel free to contact our office at (949) 809-5000.

Respectfully submitted,

Don Lee, PG, CHG

Instrument

Instrument type	Trimble VX/S Series
EDM Refractive Index	274.1
EDM Carrier Wavelength	79.3
Horizontal circle mode	Set to azimuth
Horizontal Angle Precision	0°00'03"
Vertical Angle Precision	0°00'03"
EDM precision	3mm +2ppm
EDM constant	0mm
Backsight centering error	0.010

Instrument details

Model	S6 3" DR 300+
Serial number	92712141
Firmware version	R12.5.54
Horizontal collimation	0°00'00"
Vertical collimation	0°00'00"
Trunnion axis tilt correction	0°00'00"

Atmosphere

Pressure	1013.30mbar	Temperature	28.3°C	ppm	7.6				
Curvature correction	No	Refraction correction	No	Refraction const.
