LOS ANGELES COUNTY

TOPOGRAPHY

The County of Los Angeles covers an area of 4,083 square miles and measures approximately 66 miles in the east - west and 73 miles in the north - south directions.

The terrain within the County can be classified in broad terms as being 25 percent mountainous; 14 percent coastal plain; and 61 percent hills, valleys, or deserts. Elevation of the terrain ranges from sea level to a maximum elevation of 10,000 feet. The coastal plain is generally of mild slope and contains relatively few depressions or natural ponding areas. The slopes of main river systems crossing the coastal plain, such as the San Gabriel River, Los Angeles River, and Ballona Creek, range from 4 to 14 feet per mile.

Topography in the mountainous area is generally rugged with deep, V-shaped canyons separated by sharp dividing ridges. Steep walled canyons with side slopes of 70 percent or more are common. The gradient of principal canyons in the San Gabriel Mountains ranges from 150 to 850 feet per mile. Mountain ranges are aligned in a general east-west direction with the dominant range being the San Gabriel Mountains. The majority of mountain ridges lie below Elevation 5,000 feet. The total area above this level is approximately 210 square miles.

GEOLOGY - SOILS

Igneous, metamorphic, and sedimentary rock groups are all present within the County. The San Gabriel Mountains and Verdugo Hills are composed primarily of highly fractured igneous rock, with large areas of granitic rock formation being exposed. Faulting and deep weathering have produced porous zones in the rock formation; however, rock masses have produced a comparatively shallow soil mantle due to the steepness of slopes which accelerates erosion of the fine material.

Other mountains and hilly reaches are composed primarily of folded and faulted sedimentary rocks, including shale, sandstone, and conglomerate. Residual soils in these areas are shallow and generally less pervious than those of the San Gabriel Mountain range.

Valley and desert soils are alluvial and vary from coarse sand and gravel near canyon mouths to silty clay, clay and sand and gravel in lower valleys and the coastal plain. The alluvial fill has accumulated by repeated deposition of sediments to depths as great as several thousand feet. This fill is quite porous in areas of relatively low clay content. Geologic structures and irregularities in the underlying bedrock divide the alluvium into several groundwater basins. Valley soils are generally well drained but there are a few areas containing perched water.

LAND USE

The principal vegetative cover of upper mountain areas consists of various species of brush and shrubs known as chaparral. Most trees found on mountain slopes are oak, with alder, willow, and sycamore found along streambeds at lower elevations. Pine, cedar, and juniper are found in ravines at higher elevations and along high mountain summits.

The chaparral is extremely flammable, and extensive burns of the mountain vegetation frequently occur during dry, low-humidity weather accompanied by high winds. Chaparral has the ability to sprout following fire and grows rapidly to re-establish the watershed cover within a period of 5 to 10 years.

Grasses are the principal natural vegetation on the hills. Much of the hill land and nearly all of the valley land in the densely populated portion of the County south of the San Gabriel Mountains has been converted to urban and suburban use. Development of the Santa Clarita Valley and desert areas to the north of the San Gabriel Mountains is sparse at present but is proceeding rapidly.

CLIMATE

The climate within the County varies between subtropical on the Pacific Ocean side of the San Gabriel Mountain range to arid in the Mojave Desert. Nearly all precipitation occurs during the months of December through March. Precipitation during summer months is infrequent, and rainless periods of several months are common. Snowfall at elevations above 5,000 feet is frequently experienced during the winter storms, but the snow melts rapidly except on higher peaks and the northern slopes. Snow is rarely experienced on the coastal plain.

January and July are the coldest and warmest months of the year, respectively. At the Los Angeles civic center, the 30-year average daily minimum temperature for January is 48 degrees (Fahrenheit). The average daily maximum temperature for July is 84 degrees. At Mount Wilson (Elevation 5,850 feet), the 30-year average daily minimum temperature for January is 35 degrees and the average daily maximum temperature for July is 80 degrees.

HYDROMETEOROLOGIC CHARACTERISTICS

Coastal and Mountain Areas

Precipitation (rainfall) in the Los Angeles area occurs primarily in the form of winter orographic rainfall associated with extra tropical cyclones of North Pacific origin. Major storms consist of one or more frontal systems and occasionally last four days or longer. Air masses and frontal systems associated with major storms commonly extend for 500 to 1,000 miles in length and produce rainfall simultaneously throughout the County. Major storms approach Southern California from the west or northwest with southerly winds which continue until frontal passage. The mountain ranges lie directly across the path of the inflow of warm, moist air, and orographic effects greatly intensify precipitation.

The seasonal normal rainfall in the County of Los Angeles ranges from 26.72 inches in the San Gabriel Mountains to 7.27 inches in the desert. The average annual rainfall for the County is 15.17 inches.

The effects of snowmelt upon flood runoff are of significance in the few cases when warm spring rains from southerly storms fall on a snowpack. During major storms, temperatures throughout the County may remain above freezing. Average individual storm rainfall amounts and intensities conform to a fairly definite aerial pattern which reflects general effects of topographic differences.

Desert Areas

Summer convective rainfall is principally experienced in the upper San Gabriel Mountains and the Mojave Desert regions. In many desert areas, the most serious flooding occurs as a result of summer convective storms.

Mountain Areas

In mountain areas, the steep canyon slopes and channel gradients promote a rapid concentration of storm runoff. Depression storage and detention storage effects are minor in the rugged terrain. Soil moisture during a storm has a pronounced effect on runoff from the porous soils supporting a good growth of deep-rooted vegetation such as chaparral. Soil moisture deficiency is greatest at the beginning of a rainy season, having been depleted by the evapotranspiration process during the dry summer.

months. Precipitation during periods of soil moisture deficiency is nearly entirely absorbed by soils, and except for periods of extremely intense rainfall, significant runoff does not occur until soils are wetted to capacity. Due to high infiltration rates and porosity of mountain soils, runoff occurs primarily as subsurface flow or interflow in addition to direct runoff. Spring or base flow is essentially limited to portions of the San Gabriel Mountain range. Consequently, most streams in the County are intermittent.

Runoff from a mountain watershed recently denuded by fire exceeds that for the unburned state due to greatly increased quantities of inorganic debris present in the flow and increased direct runoff resulting from lowered infiltration rates. Debris production from a major storm has amounted to as much as 223,000 cubic yards per square mile of watershed. Boulders up to eight feet in diameter have been deposited in valley areas a considerable distance from their source.

Debris quantities equal in volume to the storm runoff (100 percent bulking) have been recorded in major storms. Where debris-laden flow traverses an alluvial fill unconfined by flood control works, flood discharges follow an unpredictable path across the debris cone formed at the canyon mouth.

Hilly and Valley Areas

In hilly areas, runoff concentrates rapidly from the generally steep slopes; however, runoff rates from undeveloped hilly areas are normally smaller than those from mountain areas of the same size. In those hilly areas which were developed for residential use, concentration times become considerably decreased due to drainage improvement, and runoff volumes and rates have increased due to increased imperviousness. On the other hand, erosion is controlled and debris is minimized from storm flows. Debris production rates from undeveloped hill areas are normally smaller than those from mountain areas of the same size.

In highly developed valley areas, local runoff volumes increased as the soil surface became covered by impervious materials. Peak runoff rates for valley areas also increased due to elimination of natural ponding areas and improved hydraulic efficiency of water carriers such as streets and storm drain systems.

LOS ANGELES COUNTY FLOOD CONTROL DISTRICT

Flood Control & Water Conservation

FLOODS – *An Old Story....*

Floods in the County of Los Angeles were recorded as far back as the days of the Mission Padres. For centuries' waters have swept out of the San Gabriel Mountains causing extensive property damage and taking a great toll of lives. Such a flood occurred in 1914 causing over \$10 million in property damage and taking many lives. As a result, the State legislature in 1915 enacted the statute creating the Los Angeles County Flood Control District. The responsibilities and authority vested in the Flood Control District were, in 1985, transferred to and are now part of the County of Los Angeles of Public Works.

Public Works, under the Flood Control Act, has the following tasks:

1. Protect from flood or storm waters the harbors, waterways, public highways, and property in the district.
2. Conserve water for beneficial and useful purposes.
3. Provide for public use of navigable waterways under the district's control that are suitable for recreational and educational purposes.

FLOOD CONTROL

Successful early bond issues financed the construction of dams built in the San Gabriel Mountains and foothills to impound storm waters until they could be safely released. Debris basins were constructed to trap eroded materials which caused terrible damage in the past. Flood channel improvements were undertaken to confine the waters and convey them safely through the urbanized areas to the ocean.

District engineers prepared a Comprehensive Plan in the early 1930s to control flooding and save as much of the water as practicable when fully implemented. Federal legislation in 1936 brought the U.S. Army Corps of Engineers into the local flood control picture. Since that time, the two agencies have been jointly pursuing implementation of the Comprehensive Plan. Public Works also cooperates with the U.S. Natural Resources Conservation Service and Forest Service in erosion control.

WATER CONSERVATION

In addition to its flood control program, Public Works has the equally important mission of conserving as much of the storm and other waste waters as practicable. The use of water conservation facilities in or adjacent to river channels and their tributaries permits water to be percolated into groundwater aquifers or basins for later pumping and supply to consumers. These water conservation facilities are located in areas where the underlying soils are composed of porous sands and gravel formations. Some are shallow and resemble rice paddies, while others are deep basins which were once gravel pits.

The importance of this activity is apparent when it is realized that about 30 to 40 percent of the water used in the County is pumped from groundwater supplies. The growth of the County, combined with periodic droughts, seriously depleted these supplies on numerous occasions throughout the history of the County.

Other major conservation efforts by Public Works include combating the serious salt water intrusion into groundwater supplies inland from the Pacific Ocean and utilizing imported and reclaimed water to help replenish groundwater supplies.

ORGANIZED TO THE JOB

Day-to-day administration of Public Works affairs is vested in the Director of Public Works who is appointed by and responsible to the Los Angeles County Board of Supervisors. A part of Public Works' activities involve the planning, design, and construction of flood control and water conservation facilities, and the operation and maintenance of dams, debris basins, spreading grounds, channels, and storm drains.

PRECIPITATION

Public Works operates and maintains a network of 230 standard and automatic rain gages to collect rainfall (precipitation) data for the purposes of in-house engineering and design of flood control and water conservation facilities

RAINFALL AMOUNTS

[Daily](#) and [annual](#) rainfall amounts for the reporting period collected by Public Works' [active standard rain gages](#) are published in this volume. Although Public Works operates and maintains both standard and automatic rain gages whose recording durations range from 5 minutes to 24 hours, only daily and annual amounts from standard rain gages are published herein. Additional data (e.g., intensities, automatic rain gage data, partial data) may be obtained by contacting the [custodian](#) of hydrologic records. Active rain gage stations whose records are incomplete are denoted accordingly and no data is published.

ALERT SYSTEM

Automated Local Evaluation in Real Time

Public Works operates and maintains a state-of-the-art ALERT computer system to monitor meteorological conditions in the County and Southern California in real time, i.e., as they occur. The system includes a network of field sensors that monitor and receive precipitation amounts including rainfall data from the Corps of Engineers' Los Angeles Telemetry System. All ALERT stations have been upgraded to a new, more robust system named ALERT2.

COOPERATION

The cooperation of observers in furnishing rainfall data to Public Works as a public service is appreciated. The efforts of the many agencies and individuals who so freely cooperated with us in the collection of this data resulted in the large number of complete records for the period covered by this report.

Data from 22 stations of Public Works' records are reported and published by the National Oceanic and Atmospheric Administration (NOAA)

EVAPORATION

Public Works, the Metropolitan Water District, Palmdale Water District, the California Dept. of Water Resources, and Descanso Gardens provided daily evaporation data for 12 evaporation stations during the reporting period. [Monthly and Seasonal](#) summaries are provided in the report. Daily records of active and inactive stations are available in Public Works' files, along with some data for other agencies and districts. This data can be obtained by contacting the [custodian](#) of hydrologic records.

LENGTH OF RECORD

The Los Angeles County Flood Control District (now administered by Public Works) installed its first evaporation pan in March 1929 at Santa Anita Dam. Public Works has data for 37 evaporation stations which have monthly evaporation for more than 15 seasons.

- Prefix **F** - Indicates a station originally owned and operated by the Los Angeles County Flood Control District and now owned and operated by Public Works.
- Prefix **E** - Indicates a station owned by the U.S. Army Corps of Engineers, but operated and maintained by the U.S. Geological Survey.
- Prefix **U** or **G** - Indicates a station originally constructed and operated by the U.S. Geological Survey, but now operated by Public Works.
- Prefix **L** - Indicates a station formerly owned by the Little Rock Water District, but now owned and operated by Public Works.
- Suffix **R** - Indicates a recorder station.
- Suffix **B, C** - Indicates that the station has been moved from its original location. B represents second location, C a third location, etc.

ALERT SYSTEM

Automated Local Evaluation in Real Time

Public Works operates and maintains a state-of-the-art ALERT computer system to monitor meteorological conditions at 24 river stage locations in the County. Public Works' ALERT System also receives rainfall, streamflow, and reservoir data from the Corps of Engineers' Los Angeles Telemetry System. All ALERT stations have been upgraded to a new, more robust system named ALERT2.

COOPERATION

Public Works receives or has access to stream flow data from other agencies. Public Works exchanges data with the following agencies:

- U.S. Geological Survey, Water Resource Division
- U.S. Army Corps of Engineers
- State Department of Water Resources
- The Metropolitan Water District of Southern California
- San Gabriel River Water Committee

RESERVOIRS

RESERVOIRS

Following the damaging flood of 1914 and creation of the Los Angeles County Flood Control District in 1915, a program of flood control and water conservation was initiated by the District. Part of this program included the construction of 14 dams which were completed between 1920 and 1939. These dams continue to be operated and maintained by Public Works to control flood waters during storm periods. Public Works makes post storm releases, when feasible, in amounts that can be conserved in downstream spreading grounds and by channel percolation. In addition, five Corps of Engineers' dams - Lopez, Hansen, Santa Fe, Sepulveda, and Whittier Narrows Dams, are operated by the Corps in conjunction with Public Works' dams to achieve flood control and/or water conservation.

RECORDS:

Public Works' 14 dams and reservoirs' locations are shown on the [map](#). Data on the yearly reservoir operation summaries for each reservoir are provided by selecting from the Yearly Summary on the left. Data for these facilities can be obtained by contacting the custodian of hydrologic records.

EROSION CONTROL

EROSION CONTROL

Each year eroded material in various forms (debris consisting of rock, sand, trees, etc.) flows out of the mountain watersheds of the County of Los Angeles. In an effort to control this potentially disruptive force, Public Works maintains a series of debris basins in canyon mouths and upstream stabilization structures in selected watersheds.

DEBRIS BASINS:

The purpose of a debris basin is to entrap the sediment flows emanating from the canyon and let the relatively desilted water pass into the downstream flood control channels.

Public Works maintained over 100 debris basins during the reporting period. Their locations are shown in a PDF [map](#) (1.67MB).

This section contains a partial list of the debris basins maintained by Public Works. Data for sediment inflow at individual debris basins and unpublished information may be obtained by contacting:

Stormwater Engineering Division
P.O. Box 1460
Alhambra, CA 91802-1460
(626) 458-6120
email: Hydrologicrecords@dpw.lacounty.gov**

STABILIZATION STRUCTURES:

Public Works constructed stabilization structures to control erosion in natural canyons. These structures serve to prevent down cutting by stabilizing alluvium deposits. In addition, they store debris generated by the watershed and serve to stabilize side banks, reducing side slope sloughing and bank erosion.

Public Works maintained 217 stabilization structures in 47 major watersheds during the reporting period. The Department has not constructed any stabilization structures since the 1973-74 water year.

EMERGENCY STRUCTURES:

Public Works constructed emergency structures (rail and timber) to entrap the debris from burned watersheds. The structures serve to protect improvements (road, channel, residence, etc.) located downstream of the watersheds.

Watersheds within the County of Los Angeles periodically burn. Maps of areas burned during the reporting period can be obtained by contacting the Stormwater Engineering Division/Hydrology Section.

WATER CONSERVATION

Information presented in this section includes amounts of local, imported, and reclaimed water conserved in groundwater recharge areas and information on the seawater barrier projects which prevent seawater intrusion into groundwater basins in the coastal areas of the County. Pertinent data is presented regarding the locations and descriptions of Public Works' water conservation facilities as well as facilities owned by others. Additional data not presented in this report or its appendices can be obtained by contacting the [custodian](#) of hydrologic records.

CONSERVING THE WATERS

In addition to the flood control program, Public Works has the equally important mission of conserving as much of the storm and other waters as practicable. The use of water conservation facilities adjacent to river channels and in soft-bottom channels permits water to percolate into groundwater basins for later pumping. These groundwater recharge facilities are located in areas where the underlying soils are composed of permeable formations and in hydraulic connection with the underlying aquifer.

The various types of water conserved, local, imported, and reclaimed are construed to have the following meanings in this section: Local water is primarily runoff due to rainfall on the mountain and valley watersheds, dam releases, and rising water within the County. Imported water is water originating outside the County either from Northern California or from the Colorado River. Reclaimed water is the effluent produced by the Whittier Narrows Water Reclamation Plant, the San Jose Creek Water Reclamation Plant, and the Pomona Water Reclamation Plant, all operated by the County of Los Angeles Sanitation District. Reclaimed water is also injected at the seawater barriers. The West Basin Municipal Water District, the Los Angeles Department of Water and Power, and the Water Replenishment of Southern California, provide advanced treated recycled water for direct injection.

The importance of this activity is apparent when it is realized that about 30 to 40 percent of the water used in the County is pumped from groundwater supplies. The growth of the County, combined with periodic droughts, has seriously depleted these supplies on numerous occasions.

Public Works' policy is to conserve the maximum possible amount of storm water consistent with runoff quantity and quality, capacities of the spreading facilities, and groundwater conditions.

IMPORTED WATER

During the reporting period, Public Works received water imported from the State Water Project in coordination with the Main San Gabriel Basin Watermaster (MSGBWM) the Water Replenishment District of Southern California (WRD), and the Upper Los Angeles River Area Watermaster (ULARAWM) at the following facilities:

- San Gabriel Canyon Spreading Grounds
- Santa Fe Spreading Grounds
- San Gabriel River
- Little Dalton Spreading Grounds
- Forbes Spreading Grounds
- Irwindale Spreading Basin/Manning Pit
- Citrus Spreading Grounds
- Ben Lomond Spreading Grounds
- Valley Rubber Dam Spreading Areas
- Pacoima Spreading Grounds
- Lopez Spreading Grounds
- Rio Hondo Coastal Spreading Grounds

WATER CONSERVATION

The MSGBWM procures imported water from the Metropolitan Water District (MWD) and San Gabriel Valley Municipal Water District (SGVMWD) on behalf of the groundwater rights holders in the Main San Gabriel Basin, Upper San Gabriel Canyon Basin, and Glendora Basin.

The WRD procures imported water from the MWD to replenish the groundwater supplies in the Central Basin.

The Cities of Los Angeles and Burbank coordinate imported water deliveries from LADWP and MWD to replenish the groundwater supplies in the San Fernando Basin.

RECYCLED WATER

The County Sanitation District's Whittier Narrows Water Reclamation Plant effluent purchased by the Water Replenishment District of Southern California is transported to the Rio Hondo and San Gabriel Coastal Basin Spreading Grounds for groundwater replenishment.

The County Sanitation District's San Jose Creek Water Reclamation Plant made its first delivery of effluent in November 1972. The effluent released into San Jose Creek, San Gabriel River, or directly delivered to San Gabriel Coastal Spreading Ground via pipeline is purchased by the Water Replenishment District of Southern California.

Water from the Pomona Reclamation Plant is released down the San Jose Creek - San Gabriel River System to Public Works' recharge facilities in the Central Basin spreading grounds.

The quantity limitations for recycled water are contained in Board Order No. R4-2009-0048-A-01, as adopted on April 10, 2014. The maximum quantity of recycled water spread in any ten-year period shall not exceed 45 percent of the total inflow from all sources into the Montebello Forebay during that period.

SEAWATER BARRIER PROJECTS

Public Works operates 315 seawater barrier injection wells to protect the groundwater in the West Coast and Central Basins against seawater intrusion by creating freshwater pressure ridges along the coastline. The amounts of water injected by these wells during the reporting period are as follows:

Facility	Imported Water (Acre-Feet)	Recycled Water (Acre-Feet)
<u>Alamitos Barrier Project:</u>		
Los Angeles Portion	1,226	2,784
Orange County Portion*	657	1,566
Dominguez Gap Barrier Project	2,320	4,819
West Coast Basin Barrier Project	4,629	8,061

*Injected on behalf of the Orange County Water District

SEASONAL DATA AND MAPS

During the reporting period, weekly, monthly, and semi-annual measurements of groundwater levels in observation wells located throughout the groundwater basins in the County of Los Angeles were made and processed.

Locations of the key wells noted herein are shown on the well map in the Water Conservation Summary section. Historical key wells level data can be viewed in [Appendix L](#).

WATER CONSERVATION

Static groundwater elevation contour maps for the three major groundwater regions in the County of Los Angeles are available from the local basin water agencies:

GROUNDWATER BASINS AND GROUNDWATER RECHARGE

Groundwater in the County of Los Angeles is stored in basins underlying five major geographic areas. These groundwater basins are separated by geologic features which impede groundwater movement or by political boundaries. A map of these groundwater basins and Public Works' spreading grounds is available upon request from Public Works. General spreading grounds facility information is included in the summary section. Monthly water conservation data for the reporting period at Public Works' facilities and other pertinent facilities are included in the Water Conservation Summary section of this report. The monthly imported and recycled water deliveries for the reporting period are also included in the Water Conservation Summary section. The following is a background summary of Public Works' groundwater recharge activities within each of these major areas:

LOS ANGELES COUNTY-WIDE

Public Works operates 2,436 acres of spreading grounds and soft-bottom channel spreading areas for replenishment of local groundwater supplies. Public Works also assisted in the operation and maintenance of 269 acres of spreading grounds owned by others. An additional 656 acres of spreading grounds are controlled maintained and operated by other agencies. The total gross acreage of spreading grounds in the County of Los Angeles is 3,361 acres.

Groundwater replenishment consists of storm runoff, imported water, and recycled water. Countywide, Public Works spread the following amounts during the reporting period:

County Rainfall Index (% of Normal)	204
Storm Runoff (acre-feet)	628,362
Imported Water (acre-feet)	60,542
Recycled Water (acre-feet)	49,751

WATER CONSERVATION

Public Works is continuing its efforts to improve its water spreading facilities in order to maximize the amounts of water conserved and to simplify the spreading operations.

SAN GABRIEL VALLEY

Public Works operates 20 spreading facilities in the San Gabriel Valley that receive direct valley runoff and flows from the San Gabriel Mountains. Some of these facilities can also receive imported water. Valleywide, Public Works spread the following amounts during the reporting period:

Total Storm Runoff * (acre-feet)	327,907
Imported Water (acre-feet)	54,572
Diversions to Grounds Owned by Others (acre-feet)	5,193

* Includes Runoff from Fish Canyon & Sierra Madre Spreading Grounds.

WATER CONSERVATION

COASTAL PLAIN

The groundwater basins underlying the Coastal Plain are divided by geological features into the Central (includes the Montebello and Los Angeles Forebays), West Coast, Santa Monica, and Hollywood Basins. Most of the water is spread in the Montebello Forebay. Public Works spread the following amounts in the the Coastal Plain during the reporting period:

Storm Runoff (acre-feet)	197,484
Imported Water (acre-feet)	0
Recycled Water (acre-feet)	49,751

Central Basin

The Central Basin has the most storage capacity of the basins in the Coastal Plain. In addition to the water recharged in Public Works' spreading facilities, water injected in the Alamitos Barrier Project also contributes to the replenishment of the pressure aquifers underlying the Central Basin. The basin contains Key Well Nos. 460K, 1601T, and 906D.

West Coast Basin

The West Coast basin is the second largest basin underlying the Coastal Plain and is separated by the Newport-Inglewood Fault zone. Groundwater is primarily recharged by Central Basin subsurface flows and by water injected by Public Works in the West Coast Basin and Dominguez Gap Barrier Projects. Groundwater elevations in the West Coast basin are below sea level except in the area of the West Coast Basin Barrier injection mound. The basin contains Key Well Nos. 1346D and 760C.

Santa Monica and Hollywood Basins

There are no Public Works spreading facilities in either of these basins.

SAN FERNANDO VALLEY

The San Fernando Valley is also known as the Upper Los Angeles River Area (ULARA). Most of the runoff from the surrounding mountains flows to the Valley. The Valley is composed of four basins:

San Fernando Main Basin

The basin is the largest basin underlying the San Fernando Valley. The basin contains Key Well Nos. 3872H and 4709. Public Works spread the following during the reporting period:

Storm Runoff (acre-feet)	102,972
Imported Water (acre-feet)	6,016
Recycled Water (acre-feet)	0

WATER CONSERVATION

Sylmar, Verdugo, and Eagle Rock Basins

Public Works has no spreading facilities in these much smaller basins.

SANTA CLARITA VALLEY

Public Works has no spreading facilities in the area. Much of the Valley is open space, permitting substantial natural percolation. The Upper Santa Clarita subunit comprises five basins.

ANTELOPE VALLEY

There are several groundwater subbasins underlying the Antelope Valley. Five of them are located within the County of Los Angeles. Public Works operates no spreading facilities in the Antelope Valley. Key Well Nos. 9974 and 8825 are located in the Lancaster and Little Rock sub basins, respectively.
