CONSERVATION

INTRODUCTION

This report contains hydrologic data within Los Angeles County for the period beginning October 1, 1974, and ending September 30, 1975. Also included are summaries of data at selected locations for all years of record. The data are presented in six sections.

1. Precipitation - summarizes precipitation data for over 450 locations and discusses weather modification activities within Los Angeles County.

2. Evaporation - lists all locations for which evaporation data is on file and provides monthly evaporation amounts at 24 locations for all years of record.

3. Runoff - presents daily and seasonal runoff amounts for 60 streamflow stations and four Metropolitan Water District outlets.

4. Dam Operation - lists mean daily inflow, outflow, water surface elevation, and storage amounts as well as a summary of annual events for 14 dams and reservoirs.

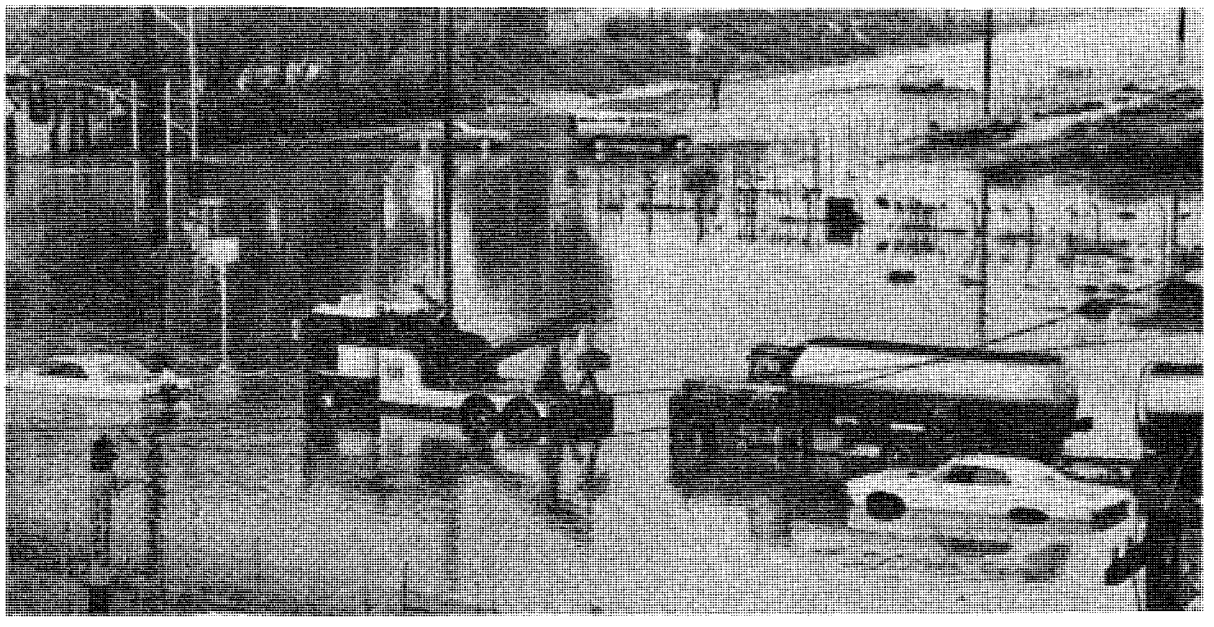
5. Erosion Control - presents debris histories for debris basins and maps of major watershed burns.

6. Water Quality Monitoring - presents maps of surface and groundwater sampling locations, and data at selected locations

7. Conservation and Groundwater - presents records of water conserved at various facilities, water injected at seawater barrier projects, well hydrographs, and groundwater maps for the five major groundwater basins.

Where practical, all data which would satisfy immediate needs and serve as a useful reference are published in these reports. Several tables appear listing locations where unpublished data are available. Additional information may be obtained by writing to:

Mr. A. E. Bruington, Chief Engineer
Los Angeles County Flood Control District
P. O. Box 2418, Terminal Annex
Los Angeles, CA 90051



Intersection of Sepulveda Boulevard and South Figueroa Street Following Storm of December 3 and 4, 1974 - Los Angeles Times Photo

SUMMARY OF THE 1974-75 SEASON

RAINFALL

Average rainfall over Los Angeles County was 13.24 inches (85 per cent of normal). Rainfall amounts vary considerably throughout the County, ranging from 10 inches on the Coastal Plain, to 38 inches in the mountains and then dropping sharply to 3.5 inches in the desert. For the past season, these amounts were 12.72 inches (92 per cent normal), 23.69 inches (84 per cent normal), and 4.96 inches (63 per cent normal). Very heavy intensity rainfall was experienced in several areas of the south coastal plain of Los Angeles County during the storm of December 3 and 4. Some stations recorded intensities of 50-year recurrence intervals for various durations.

Snowfall was recorded on several occasions during this season with totals of 96 and 51 inches being recorded at Big Pines Recreation Park and Crystal Lake, respectively.

The records indicate 45 per cent of the seasons total occurred during March and April, and April snowfall accounted for 30 per cent of the season total.

Los Angeles Times Photo

RUNOFF

The intense rainfall from the storm of December 3 and 4 resulted in peak flows of record at eight stream gaging stations. Most flooding was limited to the south and central portions of the County, with the more serious problems in the South Carson area. The vicinity of the intersection of Sepulveda Boulevard and Figueroa Street was as much as five feet under water. The average seasonal inflow to the Districts reservoirs was 42 per cent, while runoff for the urban drainage areas was 72 per cent of the prior 12 year average.

EVAPORATION

Evaporation for seven selected locations was 104 per cent of average.

FIRE

The largest fire occurred in the Pacoima Wash area and burned approximately 7,000 acres.

EROSION

The average annual erosion rate into the District's debris basin was 2,000 cubic yards per square mile. The prior historical average was 5,000 cubic yards per square mile.

CONSERVATION

During the 1974-75 season, over 134,000 acre-feet of local water, 98,000 acre-feet of imported water, and 22,000 acre-feet or reclaimed water were used to replenish the ground-water basins from spreading facilities, injection facilities, reservoirs, and unlined channels.

SEAWATER BARRIER PROJECTS

The District operates three barrier projects to protect the ground water in the West Coast and Central Basins against sea-water intrusion by creating a freshwater pressure ridge at key locations along the coastline. These pressure ridges are created by injecting fresh water into the ground through a series of injection wells. During the period, 26,434 acre-feet of water were injected at the West Coast Basin Barrier Project, 5,161 acre-feet at the Dominguez Gap Barrier Project and 5,159 acre-feet at the Alamitos Barrier Project.

ABOUT LOS ANGELES COUNTY

TOPOGRAPHY

The Los Angeles County Flood Control District includes an area of 2,760 square miles with boundary contiguous to the County boundary. The most northerly portion and channel islands are excluded. The District measures approximately 66 miles in east-west and 55 miles in north-south directions.

The terrain within the District can be classified in broad terms as being 39 per cent mountainous, 17 per cent coastal plain; and 44 per cent hills, valleys, or deserts. Relief of the terrain ranges from sea level to a maximum elevation of 10,000 feet. The coastal plain is generally of mild slope and contains relatively few depressions or natural ponding areas. The slopes of main river systems crossing the coastal plain, such as the San Gabriel River, Los Angeles River, and Ballona Creek, range from 4 to 14 feet per mile.

Topography in the mountainous area is generally rugged with deep, V-shaped canyons separated by sharp dividing ridges. Steep-walled canyons with side slopes of 70 per cent or more are common. The gradient of principal canyons in the San Gabriel Mountains ranges from 150 to 850 feet per mile. Mountain ranges are aligned in a general east-west direction, the major range being the San Gabriel Mountains. The majority of mountain ridges lie below Elevation 5,000, the total area above this level being approximately 210 square miles.

GEOLOGY – Soils

Igneous, sedimentary, and metamorphic rock groups are all represented within the District. The San Gabriel Mountains and Verdugo Hills are composed primarily of highly fractured igneous rock, with large areas of granitic rock formation being exposed above soils which are coarse and porous. Faulting and deep weathering have produced porous zones in the rock formation; however, rock masses have produced a comparatively shallow soil mantle due to the steepness of slopes which accelerates erosion of the fine material.

Other moutainous and hilly reaches within the District are composed primarily of folded and faulted sedimentary rocks, including shale, sandstone, and conglomerate. Residual soils in these areas are shallow and are generally less pervious than those of the San Gabriel mountain range.

Valley and desert soils are alluvial and vary from coarse sand and gravel near canyon mouths to silty clay and gravel or clay in lower valleys and the coastal plain. The alluvial fill has been built up by repeated deposition of debris to depths as great as 2,000 feet in places. This fill is quite porous in areas of relatively low clay content. Impervious layers and irregularities in the underlying bedrock divide the alluvium into several distinct ground water basins. Valley soils are generally well drained and relatively few perched water or artesian areas are present.

LAND USE

The principal vegetative cover of upper mountain areas consists of various species of brush and shrubs known as chaparral. Most trees found on mountain slopes are oak, with alder, willow, and sycamore found along streambeds at lower elevations. Pine, cedar, and juniper are found in ravines at higher elevations and along high mountain summits.

The chaparral is extremely flammable, and extensive burns of the mountain vegetation frequently occur during dry, low-humidity weather accompanied by high winds. Chaparral has the ability to sprout following fires and grows rapidly to re-establish the watershed cover within a period of 5 to 10 years.

Grasses are the principal natural vegetation on the hills. Much of the hill land and nearly all of the valley land in the densely popu-

lated portion of the District south of the San Gabriel Mountains has been converted to urban and suburban use. Development of the Santa Clarita Valley and desert areas to the north of the San Gabriel Mountains is sparse at present but is proceeding at an accelerated rate.

CLIMATE

The climate within the District varies between subtropical on the Pacific Ocean side of the San Gabriel mountain range to arid in the Mojave Desert. Nearly all precipitation occurs during the months of December through March. Precipitation during summer months is infrequent, and rainless periods of several months are common. Snowfall at elevations above 5,000 feet is frequently experienced during the winter storms, but the snow melts rapidly except on higher peaks and the northern slopes. Snow is rarely experienced on the coastal plain.

January and July are the coldest and warmest months of the year, respectively. At Los Angeles, the 30-year average daily minimum temperature for January is 46.6 degrees above zero. The average daily maximum temperature for July is 83.3 degrees. At Mount Wilson (elevation 5,850 feet), the 25-year average daily minimum temperature for January is 34.5 degrees above zero and the average daily maximum temperature for July is 80.2 degrees.

HYDROMETEOROLOGIC CHARACTERISTICS

Coastal and Mountain Areas

Precipitation in the Los Angeles area occurs primarily in the form of winter orographic rainfall associated with extratropical cyclones of North Pacific origin. Major storms consist of one or more frontal systems and occasionally last four days or longer. Air masses and frontal systems associated with major storms commonly extend for 500 to 1,000 miles in length and produce rainfall simultaneously throughout the District. Major storms approach Southern California from the west or southwest with southerly winds which continue until frontal passage. The mountain ranges lie directly across the path of the inflow of warm, moist air, and orographic effects cause precipitation to be greatly intensified.

The effect of snowmelt upon flood runoff is of significance in the few cases when warm spring rains from southerly storms fall on a snowpack. During major storms, temperatures throughout the District may remain above freezing.

Average individual storm rainfall amounts and intensities conform to a fairly definite areal pattern which reflects general effects of topographic differences.

Desert Areas

Summer convective rainfall is principally experienced in the upper San Gabriel Mountains and the Mojave Desert regions. In many desert areas, the most serious flooding occurs as a result of summer convective storms.

RUNOFF CHARACTERISTICS

Mountain Areas

In mountain areas, the steep canyon slopes and channel gradients are conducive to rapid concentration of storm runoff quantities. Depression storage and detention storage effects are minor in the rugged terrain. Soil moisture during a storm has a pronounced effect on runoff from the porous soils supporting a good growth of deep-rooted vegetation such as chaparral. Soil moisture deficiency is greatest at the beginning of a rainy season, having been depleted by evapotranspiration process during the dry summer months. Precipitation during periods of soil moisture deficiency is nearly entirely absorbed by soils, and except for periods of extremely intense rainfall, significant runoff does not occur until soils are wetted to field moisture capacity. Due to high infiltration rates and porosity of mountain soils, runoff occurs primarily as subsurface flow or interflow rather than as direct runoff. Spring or base flow is essentially limited to portions of the San Gabriel mountain range, most streams in the District being intermittent.

Runoff from a mountain watershed recently denuded by fire exceeds that for the unburned state due to greatly increased quantities of inorganic debris present in the flow and lowered infiltration rates. Large amounts and sizes of debris have been transported by flood flows from a denuded watershed. Debris production from a major storm has amounted to as much as 120,000 cubic yards per square mile of watershed. Boulders up to eight feet in diameter have been deposited in a valley area a considerable distance from their source. Debris quantities equal in volume to storm runoff, or in other words 100 per cent bulking of runoff from a major storm, have been recorded. Where debris-laden flow traverses an alluvial fill unconfined by flood control works, flood discharges follow an unpredictable path across the debris cone formed at the canyon mouth.

Hill and Valley Areas

In hill areas, runoff concentrates rapidly from the generally steep slopes; however,

runoff rates from undeveloped hill areas are normally smaller than those from mountain areas of the same size. In those hill areas which have been developed for residential use, concentration times become considerably decreased due to drainage improvements, and runoff volumes and rates become increased due to increased imperviousness. On the other hand, erosion is controlled and debris content of storm flow is practically eliminated. Debris production rates from undeveloped hill areas are normally smaller than those from mountain areas of the same size.

In highly developed valley areas, local runoff volumes have increased as the soil surface has become covered by impervious materials. Peak runoff rates for valley areas have also increased due to elimination of natural ponding areas and improved hydraulic efficiency of water carriers such as streets and storm drain systems.

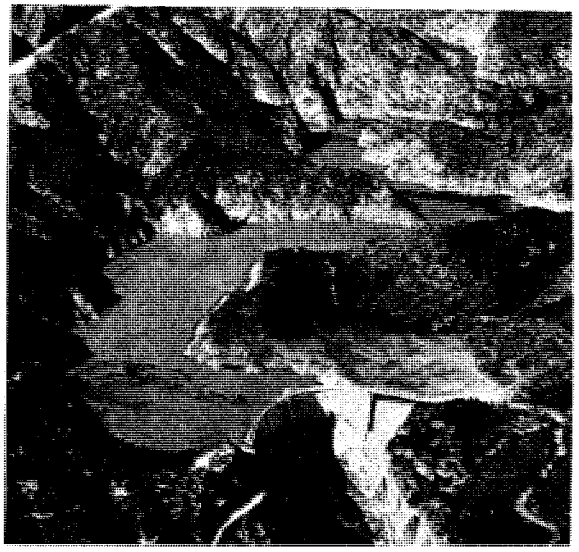
THE LOS ANGELES COUNTY FLOOD CONTROL DISTRICT

FLOODS . . . AN OLD STORY

Floods in Los Angeles County have been recorded as far back as the days of the Mission Padres. For centuries waters have swept out of the San Gabriel Mountains causing extensive property damage and taking a great toll of lives.

Such a flood occurred in 1914 causing over $10 million in property damage and taking many lives. As a result, the State legislature passed an act creating the Los Angeles County Flood Control District.

The District was assigned two tasks... control the floods and conserve the water.



Big Tujunga Dam

CONTROLLING THE WATERS

Successful early bond issues financed construction of the 14 dams which the District built high in the San Gabriel Mountains to impound storm waters until they could be released in an orderly fashion. Debris basins were constructed to trap eroded materials which had caused terrible damage in the past. Flood channel improvements were undertaken to confine the waters.

District engineers prepared a Comprehensive Plan in the early 1930's which provided for the control of flooding and the saving of as much of the water as praticable. With minor modifications, it is still the plan today.

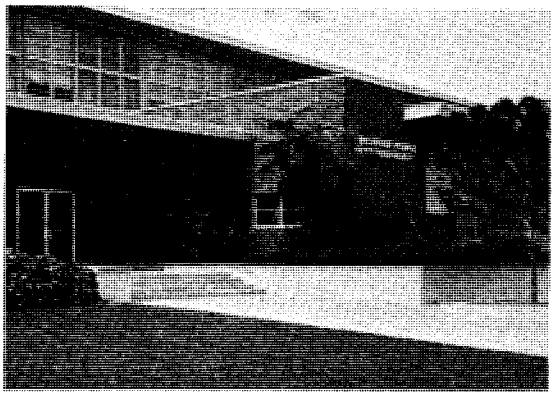
Federal legislation in 1936 brought the United States Army Corps of Engineers into the local flood control picture. Since that time, the two agencies have been jointly prosecuting construction of the Comprehensive Plan which is now nearing completion. The District also cooperates with the United States Soil Conservation Service and Forestry Service in erosion control and debris reduction programs.

CONSERVING THE WATERS

In addition to its flood control program, the District has the equally important task of conserving as much of the storm and other waste waters as practicable. The use of spreading grounds adjacent to river channels and their tributaries permits water to be percolated into underground reservoirs for later pumping by consumers. These spreading grounds are composed of porous sands and gravels and look somewhat like rice paddies.

The importance of this activity is apparent when it is realized that over 40 per cent of the water used in the County is pumped from underground supplies. The growth of the County combined with a prolonged drought has seriously depleted these supplies in recent years.

Other major conservation efforts by the District include combatting the serious intrusion by salt water of fresh well supplies along the Pacific Ocean, studying the feasibility of using reclaimed sewage waters in spreading operations, and applied research to determine the effectiveness of cloud seeding to provide additional waters for percolation.



District Headquarters

ORGANIZED TO DO THE JOB

Day to day administration of District affairs is vested in the Chief Engineer who is appointed by and responsible to the Los Angeles County Board of Supervisors. The dual mission of the agency is recognized in its organization. Although a large part of the District's activities involve the construction of flood control and water conservation facilities, the operation and maintenance of dams, debris basins, spreading grounds, channels, and storm drains are also of great importance.

Some 1,600 civil service employees serve the District, and through it the general public in a variety of tasks. Many have storm assignments which place them on call 24 hours a day throughout the winter season.

PRECIPITATION

This section contains basic precipitation data collected by the District for the water year begnning October 1, 1974, and ending September 30, 1975. In addition, the District maintains less extensive records of other climatological data such as temperature, barometric pressure, humidity, wind direction, and velocity.

RAINFALL

The daily and monthly rainfall data shown herein are based on the standard gage readings. At stations equipped with both standard and recording rain gages, the standard gage amounts are proportioned to the chart amounts at the designated time of reading. Storm total amounts caught by storage-type gages are proportioned to nearby stations for daily and monthly figures. Generally, the District uses a 5 p.m. time of reading but recognizes other times of readings at stations where the observer is not available at 5 p.m. Daylight Saving Time was observed for the October 1, 1974, to October 27, 1974, and February 23, 1975, to September 30, 1975.

WEATHER MODIFICATION

As part of its water conservation efforts in the Los Angeles area, the District has conducted weather modification activities since the 1961-62 season. This program is intended to increase rainfall only in certain predetermined "target" areas within the drainage basins upstream of Pacoima, Big Tujunga, and San Gabriel Dams. This increased rainfall results in additional runoff which is collected at these reservoirs and is later released to various spreading facilities downstream to replenish the ground water supply.

The District uses four ground-based seeding devices situated at various locations within the County. Both intermittent and continuous seeding is accomplished by vaporizing a silver iodide-acetone solution and injecting it into a propane flame. The flame both crystalizes the silver iodide and provides the convection required to lift the crystals into the cloud masses where they act as nuclei. The intermittent seeding is a refinement of this technique. Rather than injecting small amounts of silver iodide into the atmosphere continuously throughout a storm, solid state flare-like devices are burned for brief 8-minute periods, emitting larger amounts of silver iodide into the concentrated rain bands which pass over the target area periodically.

Throughout the program's history it has generally been evident that the artificial nucleation devices have significantly increased rainfall in the target areas and have contributed to the District's water conservation program. Analysis of data shows that the increase in rainfall over the target areas for the history of the program has averaged approximately 10 to 15 per cent.

SNOW SURVEYS

District personnel measure snow depths and densities at 12 locations periodically within the San Gabriel Mountains. The snow pack data presented herein are based on annual snow surveys conducted on or about April 1 of each year. The snow courses range in elevation from 5,800 feet to 8,500 feet and lie within the San Antonio, San Gabriel, Little Rock, and Big Rock drainage areas.

COOPERATION

The cooperation of observers in furnishing data to this District as a public service is appreciated. The efforts of the many agencies and individuals who have so freely cooperated with us in the collection of these data have resulted in the large number of complete records for the season covered by this report.

DEER FLATS SNOW COURSE

LOCATION

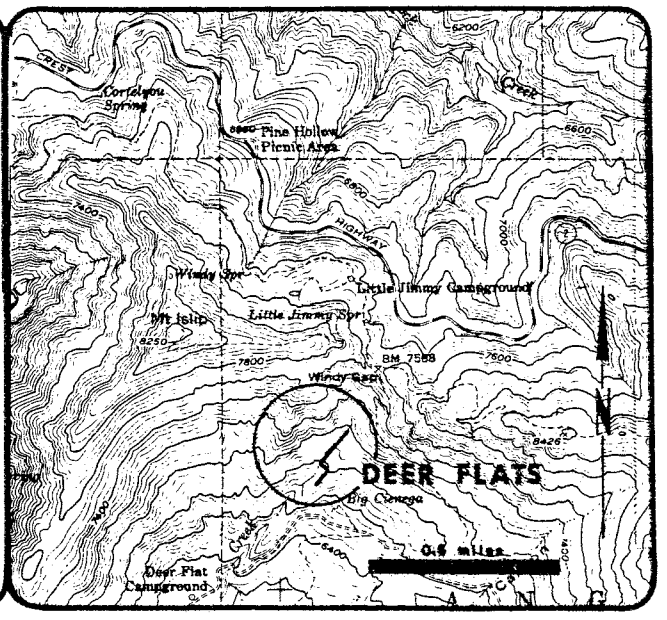
2 miles northeast of
Crystal Lake Ranger Station
San Gabriel Mountains
southern exposure

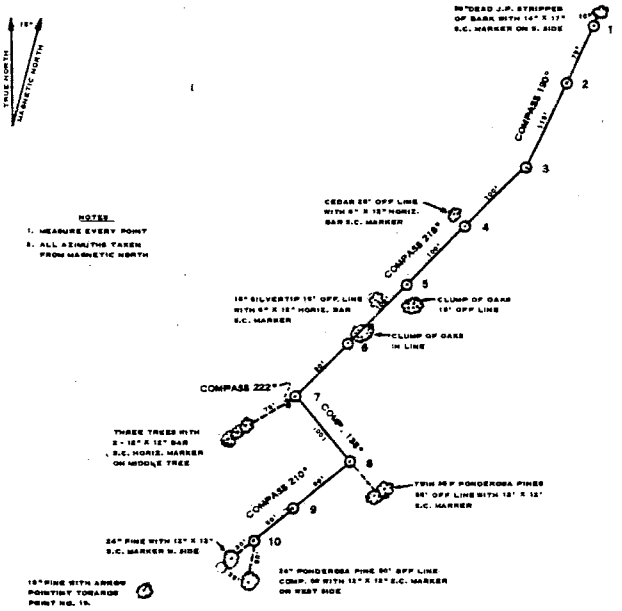
ELEVATION
6800'

LENGTH OF COURSE
880'

DRAINAGE AREA
San Gabriel River

PERIOD OF RECORD
1963 to date





CALIFORNIA COOPERATIVE SNOW SURVEYS
IN CONJUNCTION WITH
LOS ANGELES COUNTY FLOOD CONTROL DISTRICT
SAN GABRIEL RIVER BASIN
DEER FLATS COURSE
AVERAGE ELEVATION 6800' - LENGTH 880'
SCALE: 1" = 100'

SUMMARY OF ANNUAL SNOW SURVEY DATA - DEER FLATS

SEASON	AVERAGE SNOW DEPTH (IN INCHES)	AVERAGE WATER CONTENT (IN INCHES)	DENSITY (PERCENT)
1962-63	0	0	
1963-64	10.6	4.9	46
1964-65	31.3	8.5	27
1965-66	0	0

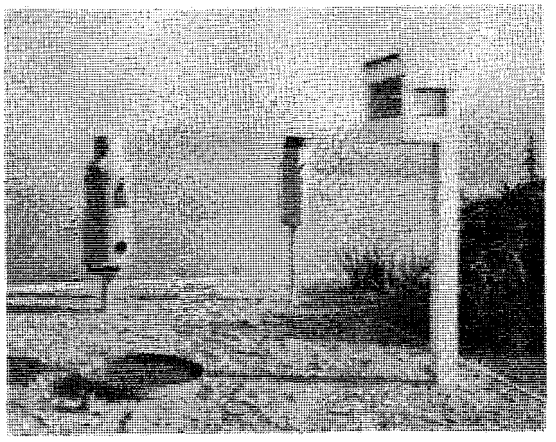
1974-75	8.2	4.3	52

EVAPORATION

Data for 24 active evaporation stations were reported to the District during the season. Daily records of active and inactive District stations, as well as some stations of other agencies, are available in the District's files. Monthly and seasonal evaporation has been published in the District's Annual or Biennial Reports on Hydrologic Data since the 1931-32 season. Evaporation is normally measured at 5 p.m. to be consistent with rainfall measurements.



Weather Station at Puddingstone Dam

SUMMARY OF EVAPORATION

The following tabulation indicates the maximum and minimum rates of evaporation in inches at stations within the County for the season. For comparative purposes, only the evaporation amounts from a 24-inch diameter land evaporation pan equipped with a screen were used.

1974-75

Maximum Seasonal Amount -	Big Tujunga Reservoir.....		80.89"
Maximum Monthly Amount -	Palmdale.....	August	12.28"
Minimum Seasonal Amount -	Baldwin Park Experimental Station.....		48.54"
Minimum Monthly Amount -	Camp Hi Hill (Opid's).....	November	1.02"

COOPERATION

The District receives evaporation data from the Los Angeles City Department of Water and Power, The Metropolitan Water District, the Southern California Edison Company, the United States Forest Service, County departments, and various individuals.

LENGTH OF RECORD

The first land pan installed by this District was at Santa Anita Dam in March of 1929. There are 30 evaporation stations which have records of 15 seasons or more in the District's files.

EQUIPMENT

1. Land pan, Type L-24

   Twenty-four inches in diameter by 36 inches deep. Installed in the ground 33 inches. Water in pan maintained near ground level.

2. Land pan, Type L-24S

   Same as L-24 above, except that it is equipped with a one-fourth-inch mesh hardware cloth that rests one and one-half inches below top of pan.

3. Land pan, Type L-48A

   Forty-eight inches in diameter by 10 inches deep. Installed with water surface approximately 14 inches above ground level. Water surface in pan maintained at two to three inches below top of pan.

4. Land pan, Type L-72

   Seventy-two inches in diameter by 36 inches deep. Installed in the ground 33 inches. Water in pan maintained near ground level.

5. Land pan, Type L-36

   Thirty-six inches square by 18 inches deep. Installed in the ground 15 inches. Water in pan maintained near ground level.

6. Floating pan, Type F-36

   Thirty-six inches square by 18 inches deep. Mounted on float with the pan submerged to 15-inch depth. Water in pan maintained near lake level.

* = AMOUNT ESTIMATED IS GREATER THAN 10% OF TOTAL
** = AMOUNT ESTIMATED IS LESS THAN 10% OF TOTAL
# = RECORD INCOMPLETE - WATER IN PAN FROZEN
N.R. = NO RECORD
INC. = RECORD INCOMPLETE
A = PREVIOUS TO THIS DATE, PAN WAS SET IN GROUND 34 INCHES AND WATER SURFACE MAINTAINED AT GROUND LEVEL (2 INCHES BELOW TOP OF PAN). AFTER THIS DATE, PAN WAS SET IN GROUND 33 INCHES AND WATER LEVEL MAINTAINED AT GROUND LEVEL (3 INCHES BELOW TOP OF PAN). THE MEASURED RATE OF EVAPORATION WAS REDUCED AS A RESULT OF THIS CHANGE.

* = AMOUNT ESTIMATED IS GREATER THAN 10% OF TOTAL
** = AMOUNT ESTIMATED IS LESS THAN 10% OF TOTAL
\# = RECORD INCOMPLETE - WATER IN PAN FROZEN
N.R. = NO RECORD
INC. = RECORD INCOMPLETE
A = PREVIOUS TO THIS DATE, PAN WAS SET IN GROUND 34 INCHES AND WATER SURFACE MAINTAINED AT GROUND LEVEL (2 INCHES BELOW TOP OF PAN). AFTER THIS DATE, PAN WAS SET IN GROUND 33 INCHES AND WATER LEVEL MAINTAINED AT GROUND LEVEL (3 INCHES BELOW TOP OF PAN). THE MEASURED RATE OF EVAPORATION WAS REDUCED AS A RESULT OF THIS CHANGE.

RUNOFF

The District operated or received data from 96 water-stage recording stations during the season. Data from 64 of those stations are summarized and published in this volume.

Of those stations published herein, two are operated by the United States Geological Survey and four by The Metropolitan Water District. The latter show the monthly quantities of imported water delivered for spreading under several cooperative agreements.

A map showing the location of all gaging stations currently operated by the District plus those which are the responsibility of the United States Geological Survey, the United States Corps of Engineers, and the Metropolitan Water District is included herein.

RECORDS OF STREAMFLOW

Records published give the following information:

1. Station description which presents location, drainage area, type of channel, control, regulations, diversions, and available records.
2. Daily discharge tabulation which shows the mean daily runoff in second-feet and total monthly and yearly runoff in acre-feet.
3. Summary of total flows, and extremes of discharge for all years of record.

COOPERATION

The District receives streamflow data from other agencies and publishes, or has access to, the records for local stations. District hydrographers also make periodic streamflow measurements and observations at installations belonging to these organizations. Data from 25 of the District's stations are reviewed and published in the Geological Survey's annual water supply papers.

Agencies with which the District exchanges data are:

United States Geological Survey, Water Resources Division

United States Corps of Engineers

The Metropolitan Water District

San Gabriel River Water Committee

LEGEND

Stations are designated by letters and numbers which indicate ownership, operating agency, and type of station. The letters used have the following connotations:

Prefix F - indicates stations owned and operated by the Los Angeles County Flood Control District.

Prefix B - indicates a station owned by the San Bernardino County Flood Control District and operated by the Los Angeles County Flood Control District.

Prefix E - indicates station owned and operated by the Corps of Engineers, Department of the Army.

Prefix U - indicates station owned and operated by the United States Geological Survey, Water Resources Division. However, Stations U8-R and U7-R have been operated by the District since October 1, 1966, and October 1, 1971, respectively.

Prefix P - indicates station owned and operated by the District, formerly operated by the Pasadena Water Department.

Prefix L - indicates station owned and operated by the District, formerly operated in cooperation with the Little Rock-Palmdale Irrigation District.

Prefix M - indicates station owned and operated by The Metropolitan Water District.

Prefix S - indicates station owned and operated by the San Gabriel River Water Committee.

Prefix V - indicates station owned and operated by the Ventura County Water Resources Division.

Suffix R - indicates a recorder station.

Suffix S - indicates a staff gage station.

Suffix B - indicates that the station has been moved. B represents second location, C a third location, etc.

The following legend is used for indicating estimates on the daily discharge data sheets:

"a" - No gage height record due to recorder or clock failure.

"b" - No gage height record due to obstructed communication or sanded well.

"c" - Gage height record affected by backwater.

"d" - Gage height record doubtful.

"e" - Other types of estimates.

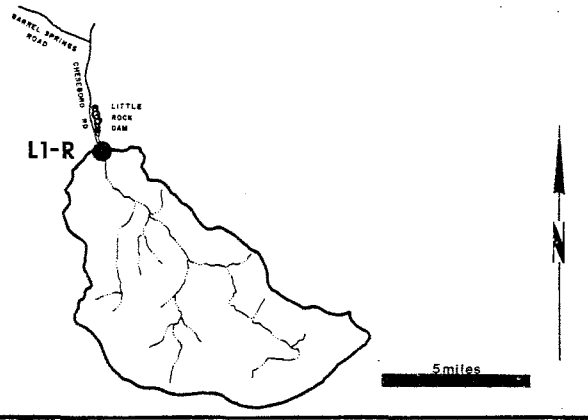
"f" - Gage height record partly estimated. (Estimated part represents less than 75 per cent of the flow; otherwise, a, b, c, or d is used.)

"v" - Gage height-discharge relation failed due to extreme and undetermined shift or unusual drawdown in stilling well.

These letters are placed in the discharge column; letters are not used if the estimated portion of the record represents less than ten per cent of the mean daily flow or if the total flow is estimated at .05 cfs or less.

STATION NO. L1-R
LITTLE ROCK CREEK
above Little Rock Dam

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 49.2 square miles

LOCATION – 2.0 miles above Little Rock Dam, 5.0 miles south of Little Rock

REGULATION – none

CHANNEL – sand, gravel, and boulders, natural in section

CONTROL – channel forms control

LENGTH OF RECORD – October 1, 1930, to date

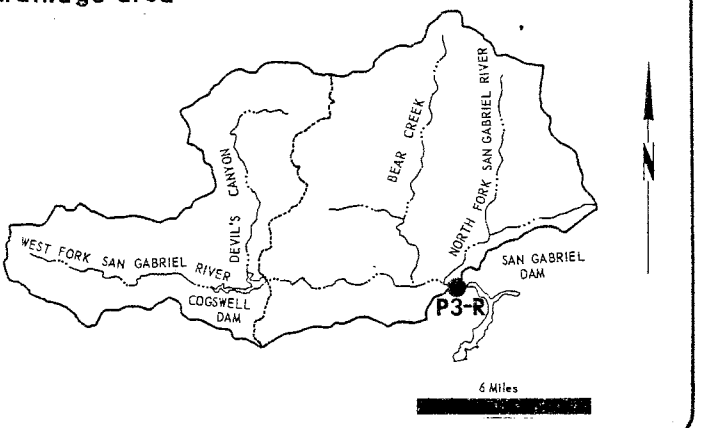
B = RECORD BEGAN AT B LOCATION 10-12-61.
\+ = LESS THAN 0.05 ACRE FEET OR CFS, BUT GREATER THAN 0.
* = RECORD INCOMPLETE

STATION NO. P3-R
SAN GABRIEL RIVER
West Fork above Forks

drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS - wading or from cable car

DRAINAGE AREA - 102.0 square miles

LOCATION - 1.5 miles above confluence with East Fork

REGULATION - partially regulated by Cogswell Dam

CHANNEL - natural, sand, gravel, and boulders

CONTROL - subject to shifts in natural bottom

LENGTH OF RECORD -
at Station P3-R, December 3, 1930, to July 12, 1938
September 27, 1938, to date
at Station P3B-R, July 12, 1938, to September 27, 1938

REMARKS - for records prior to December 3, 1930, refer to Station P1-R

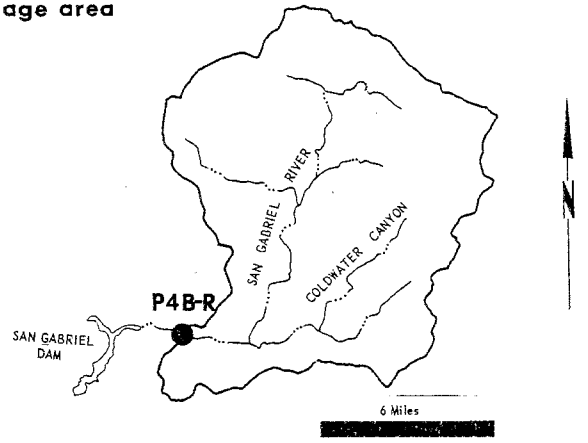
STATION NO. P4B-R
SAN GABRIEL RIVER
East Fork above Forks

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 88.2 square miles

LOCATION – 2.5 miles above the West Fork, 12.0 miles north of Azusa

REGULATION – none

CHANNEL – sand, gravels, and boulders, natural section

CONTROL – concrete, stabilizer with a 20-foot-wide low flow notch (constructed in November 1947)

LENGTH OF RECORD –
at Station P4-R, November 30, 1932, to December 10, 1938
at Station P4B-R, December 10, 1938, to date

REMARKS – the control height was increased 2.0 feet in September, 1955.

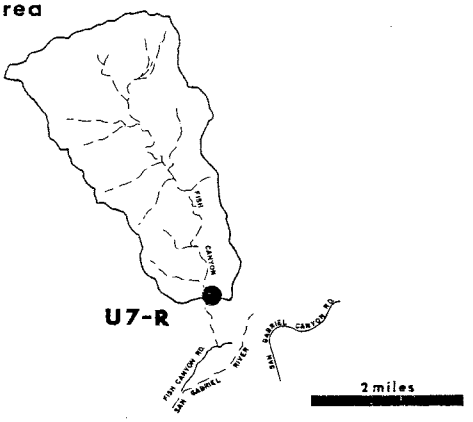
STATION NO. U 7 - R
FISH CREEK
above Mouth of Canyon

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading

DRAINAGE AREA – 6.36 square miles

LOCATION – 0.8 miles upstream of mouth of canyon and 3.0 miles northeast of Duarte

REGULATION – none

CHANNEL – natural, rock and gravel

CONTROL – concrete control

LENGTH OF RECORD – July to September 1916
July 1917 to date

REMARKS – operated and maintained by USGS until October 1, 1971; records for 1969-70 and 1970-71 seasons were furnished by USGS

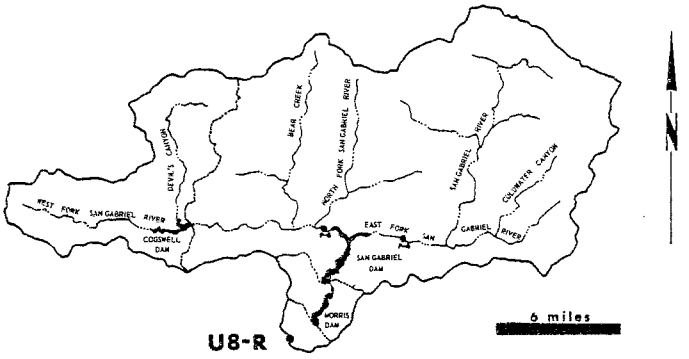
STATION NO. U 8-R
SAN GABRIEL RIVER
below Morris Dam

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 212.4 square miles

LOCATION – 1.1 miles downstream of Morris Dam, 2.7 miles northeast of Azusa

REGULATION – all flows regulated by Cogswell, San Gabriel, and Morris Dams

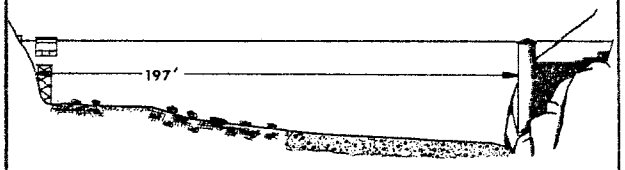
CHANNEL – gravel and boulders, natural section

CONTROL – concrete control

LENGTH OF RECORD – May 1894 to date

REMARKS – flows up to 90 cfs are at times diverted past the station through the Azusa Conduit; flows at station may include imported water from the MWD outlet below Morris Dam

cross-section



LOS ANGELES COUNTY
FLOOD CONTROL DISTRICT
HYDRAULIC DIVISION

STATION NO U8-R

ACRE-FEET 21500

Additional information:

Releases of imported water are made occasionally from the Metropolitan Water District outlet below Morris Dam. These releases are published in this report as the record of Station No. M391. Releases from this outlet flow past Gaging Station No. U8-R and are included in the record of that station.

Average discharge of local water for an 80-year period is 152 second-feet (adjusted for regulations and diversions).

Normal unregulated flow adjusted for storage in reservoirs, evaporation and diversion to the Azusa Conduit.

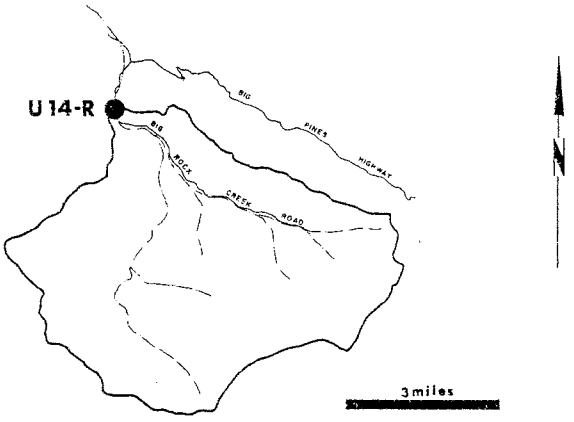
BIG ROCK CREEK
above Mouth of Canyon

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 22.9 square miles

LOCATION – 0.1 mile above Punchbowl Canyon, 0.9 mile southwest of Valyermo

REGULATION – none

CHANNEL – natural; sand, gravel, and boulders

CONTROL – channel forms control

LENGTH OF RECORD – January, 1923 to September, 1937
May 1938 to date

REMARKS - operated and maintained by USGS

cross-section

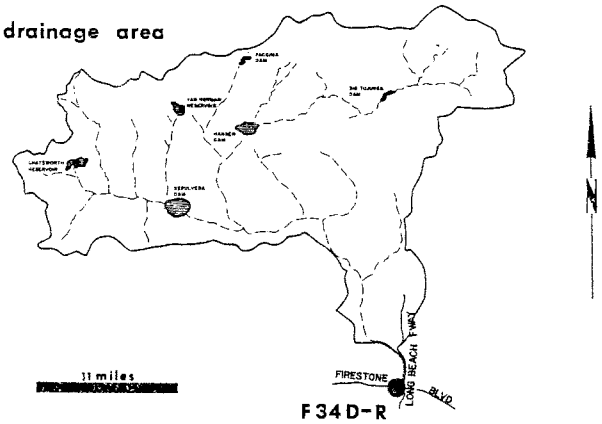
* = RECORD INCOMPLETE

STATION NO. F34D-R
LOS ANGELES RIVER
below Firestone Boulevard

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from bridge

DRAINAGE AREA – 596.0 square miles

LOCATION – 472.0 feet downstream of Firestone Boulevard 3.0 miles west of Downey

REGULATION – partially regulated by Sepulveda, Pacoima, Big Tujunga, Hansen, and Devil's Gate Dams; and by several spreading grounds, reservoirs, and debris basins.

CHANNEL – concrete, with rip-rap side slopes, trapezoidal in section, with trapezoidal low-flow channel

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F34-R, March 1, 1928 to April 11, 1938
at Station F34B-R, April 11, 1938, to November 3, 1949
at Station F34C-R, November 4, 1949, to December 11, 1956
at Station F34D-R, December 11, 1956 to date

REMARKS – subject to diversions from Big Tujunga Creek, Arroyo Seco, and other domestic and irrigation diversions

cross-section

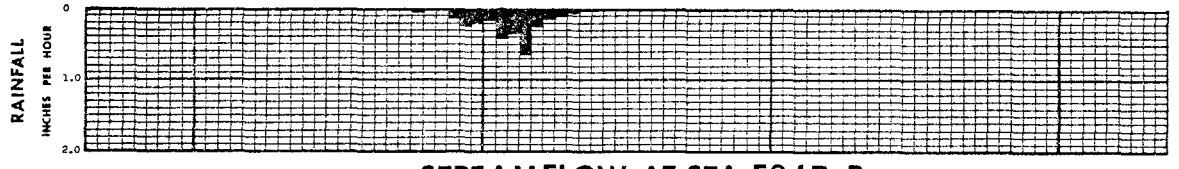
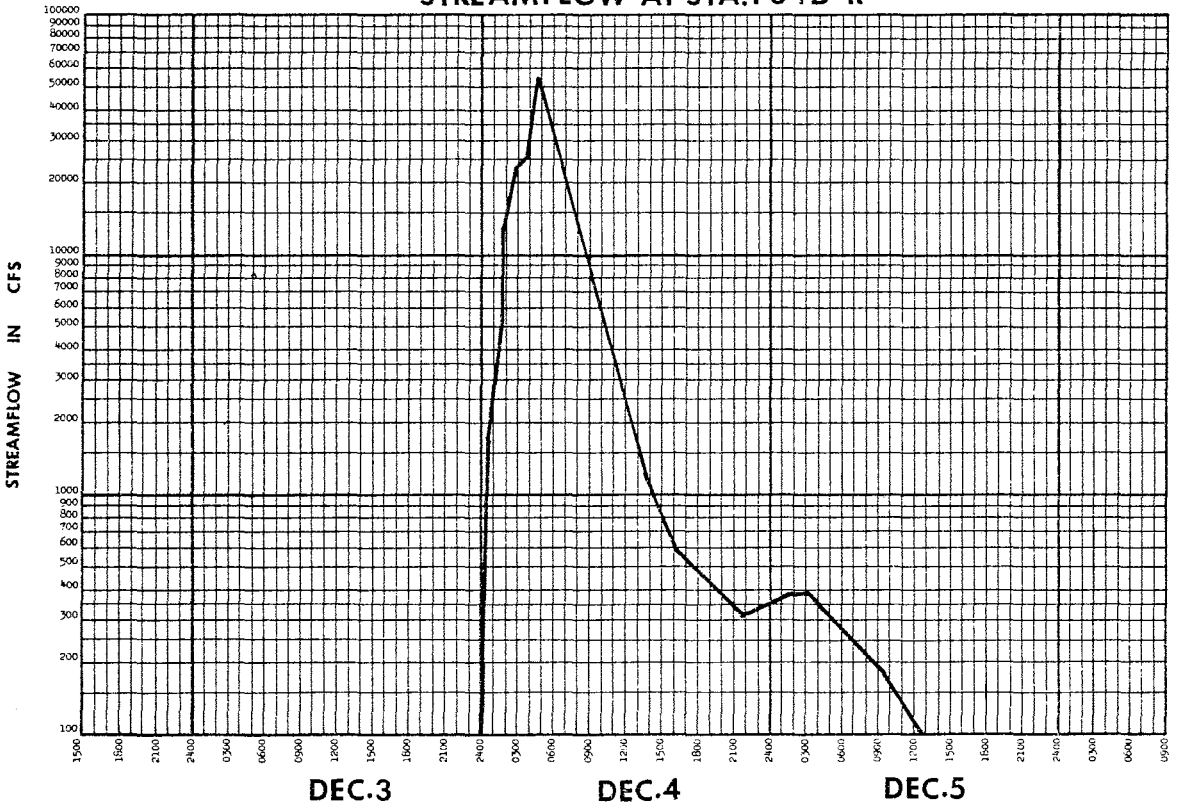
RAINFALL AT STA.191B

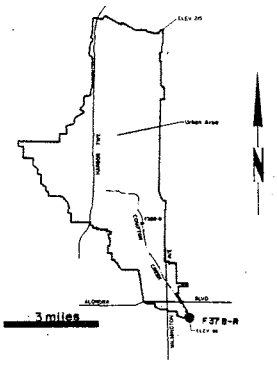


STREAMFLOW AT STA.F34D-R



STATION NO. F 37 B-R
COMPTON CREEK
near Greenleaf Drive

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from bridge

DRAINAGE AREA – 22.6 square miles

LOCATION – 120.0 feet above Greenleaf Boulevard, 1.5 miles southwest of Compton

REGULATION – none

CHANNEL – concrete, rectangular in section, 60 feet wide by 13 feet deep

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F37-R, January 22, 1928, to June 9, 1938
at Station F37B-R, October 3, 1938, to date

cross-section

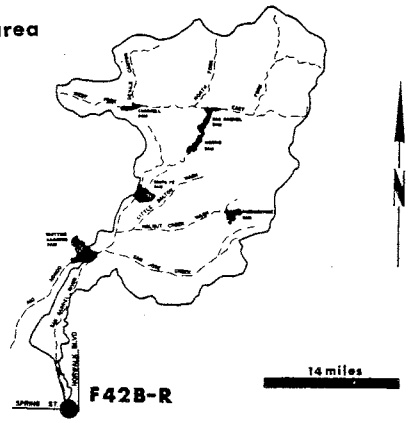
STATION NO. F 42B-R
SAN GABRIEL RIVER
above Spring Street

drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS - wading or from cable car

DRAINAGE AREA - 231.0 square miles (excludes area above Santa Fe Dam)

LOCATION - 455.0 feet north of Spring Street, 4.0 miles east of Signal Hill, Long Beach

REGULATION - partially regulated by Cogswell, San Gabriel, Morris, Santa Fe, Big Dalton, San Dimas, Puddingstone Diversion, Puddingstone, Live Oak, Thompson Creek, and Whittier Narrows Dams, several debris basins, MWD outlet, and several spreading grounds.

CHANNEL - concrete, trapezoidal section with a low-flow channel.

CONTROL - channel forms control

LENGTH OF RECORD -
at Station F42-R, February 6, 1928, to May 26, 1964
at Station F42B-R, November 16, 1964, to date

REMARKS - high flows into Whittier Narrows Reservoir are partially diverted to the Rio Hondo

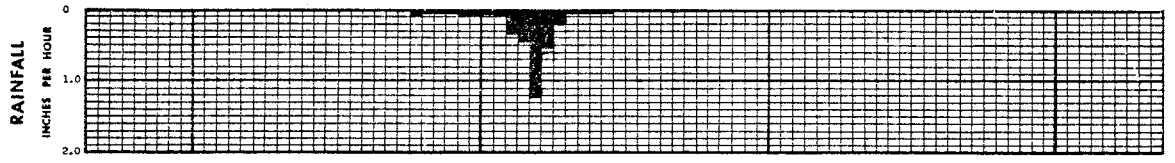
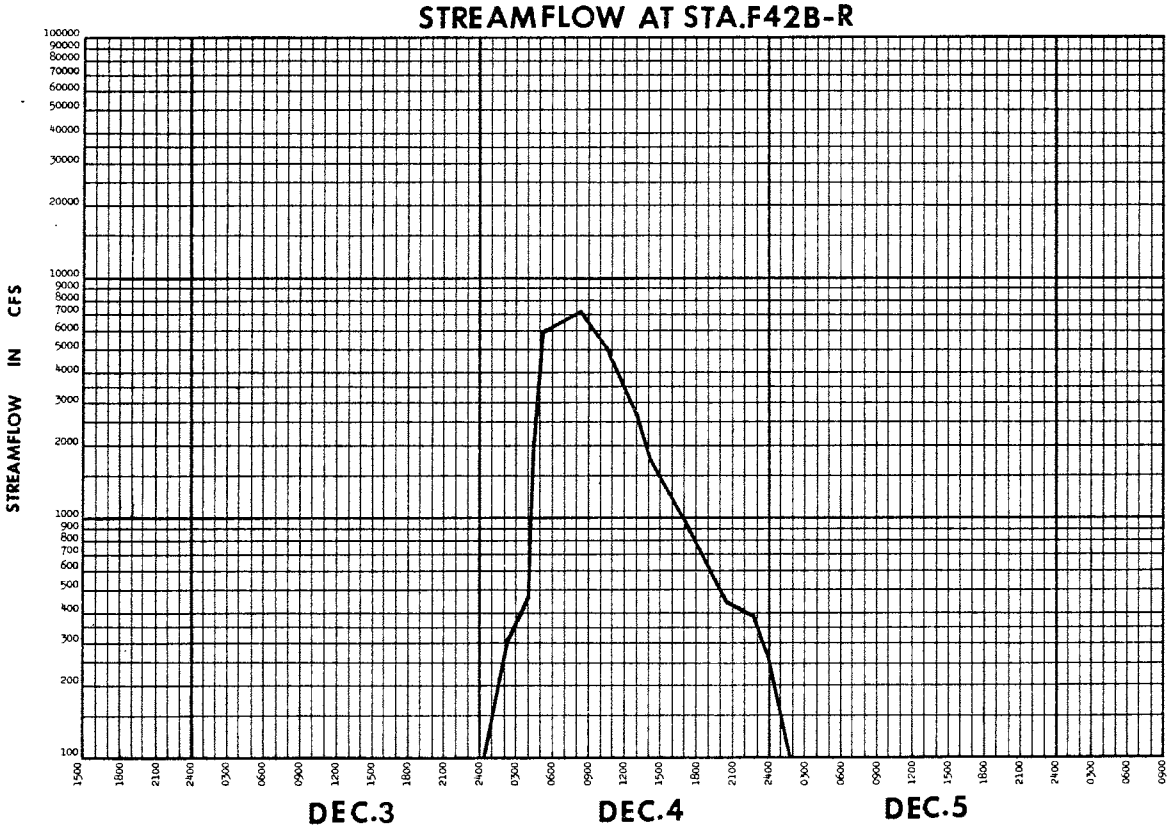
RAINFALL AT STA.566

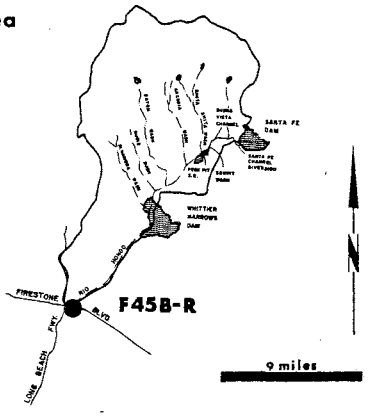


STREAMFLOW AT STA.F42B-R



STATION NO. F 45B-R
RIO HONDO
above Stewart and Gray Road

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 140 square miles (excludes area above Santa Fe Dam)

LOCATION – 0.6 mile upstream of the confluence of Rio Hondo and Los Angeles River, 1.5 miles west of Downey

REGULATION – partially regulated by Sierra Madre, Santa Anita, Sawpit, Eaton, Santa Fe, and Whittier Narrows Dams, several debris basins, and spreading grounds

CHANNEL – concrete, with rip-rap side slopes. trapezoidal in section

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F45-R, March 1, 1928, to April 18, 1951
at Station F45B-R, October 31, 1951 to date

REMARKS – subject to diversions from Eaton Creek, Monrovia Creek, Sawpit Creek, Little Santa Anita Canyon and other locations for irrigation and spreading. High flows from San Gabriel River may flow into Rio Hondo above Whittier Narrows Dam.

cross-section

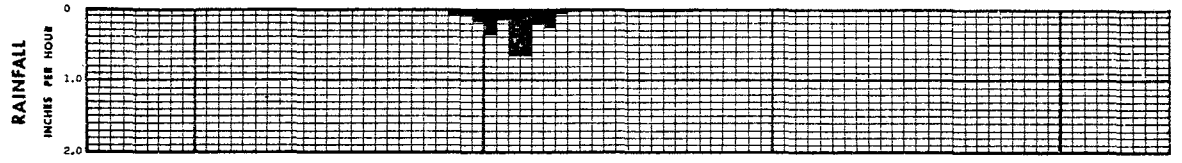
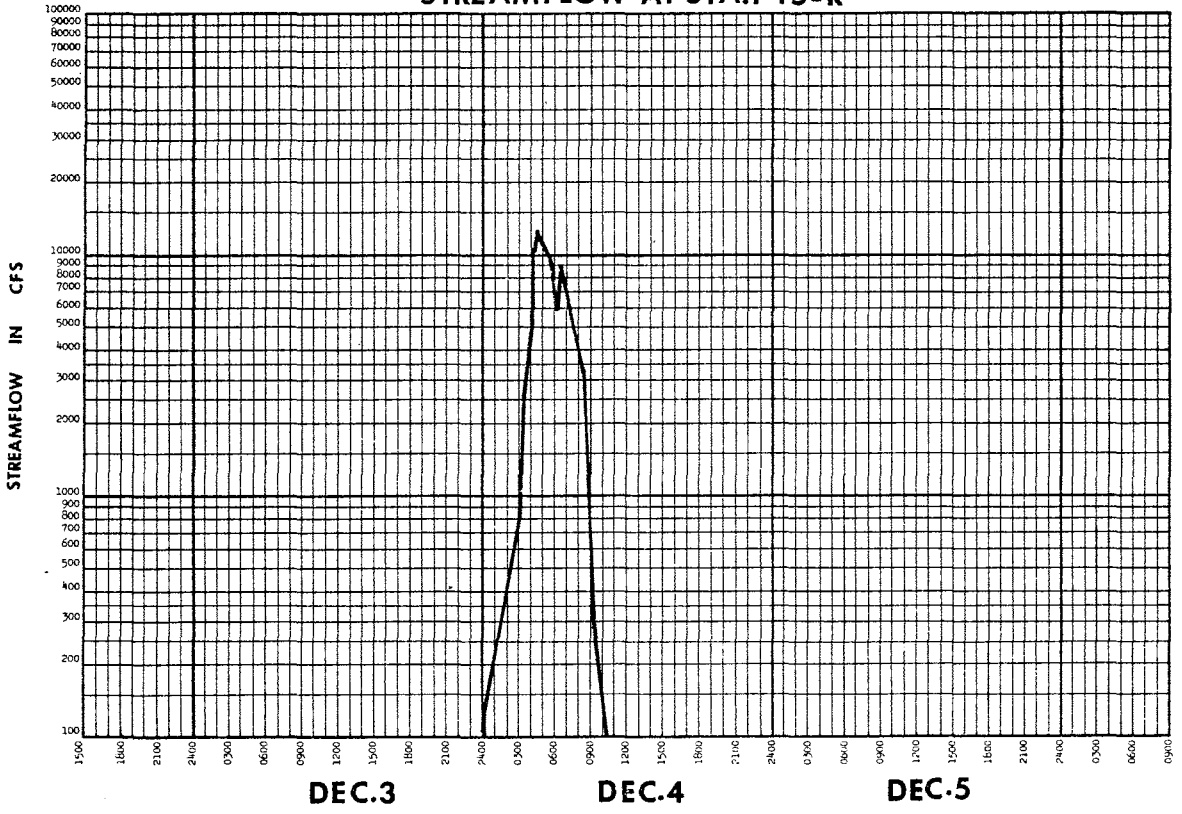
RAINFALL AT STA.1014 F

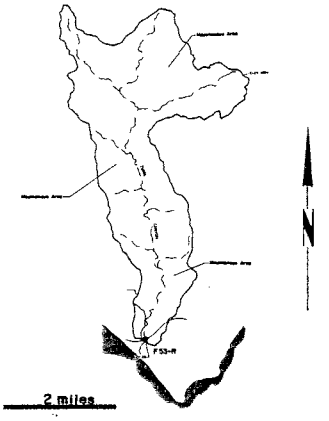


STREAMFLOW AT STA.F45-R



STATION NO. F53-R
DUME CREEK
at Pacific Coast Highway

drainage area



RECORDER - CONTINUOUS WATER STAGE

METHOD OF MEASUREMENTS - LOW FLOWS MEASURED BY WADING. HIGH FLOWS MEASURED FROM HIGHWAY BRIDGE.

DRAINAGE AREA - 8.8 SQUARE MILES

LOCATION - ON THE DOWNSTREAM SIDE OF PACIFIC COAST HIGHWAY BRIDGE NEAR DUME POINT ABOUT 0.2 MILE FROM PACIFIC OCEAN.

REGULATION - NONE

CHANNEL - SAND AND GRAVEL

CONTROL - CHANNEL FORMS CONTROL

LENGTH OF RECORD - JANUARY 15, 1930 TO NOVEMBER 26, 1937; NOVEMBER 3, 1938 TO DATE.

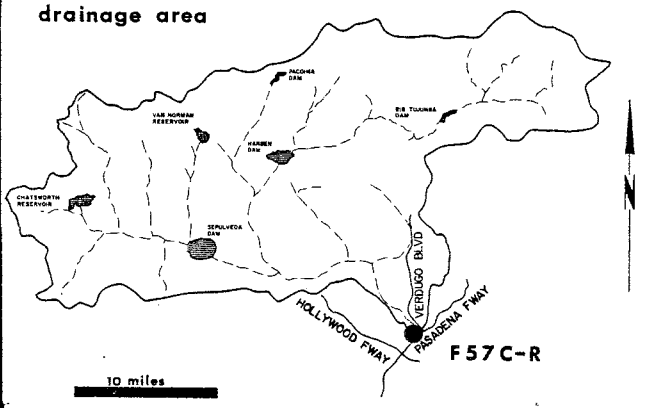
STATION NO. F 57C-R
LOS ANGELES RIVER
above Arroyo Seco

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 511 square miles

LOCATION – 800.0 feet above the confluence of the Arroyo Seco with the Los Angeles River, Los Angeles

REGULATION – partially regulated by Sepulveda, Pacoima, Big Tujunga, and Hansen Dams; and by several spreading grounds, reservoirs, and debris basins.

CHANNEL – concrete, rectangular in section, with a trapezoidal low-flow channel

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F57-R, December 5, 1929, to May 26, 1938
at Station F57B-R, April 5, 1939, to December 8, 1939
at Station F57C-R, December 8, 1939, to date

REMARKS – subject to diversions from Big Tujunga Creek, and other diversions for domestic and irrigation uses

cross section

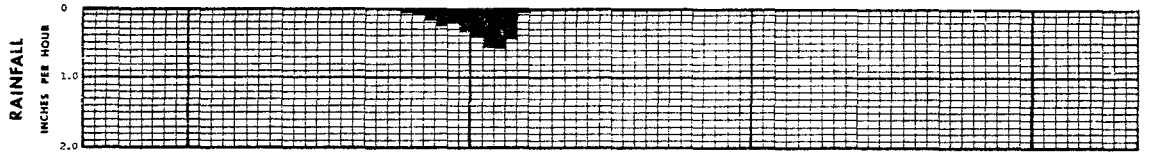
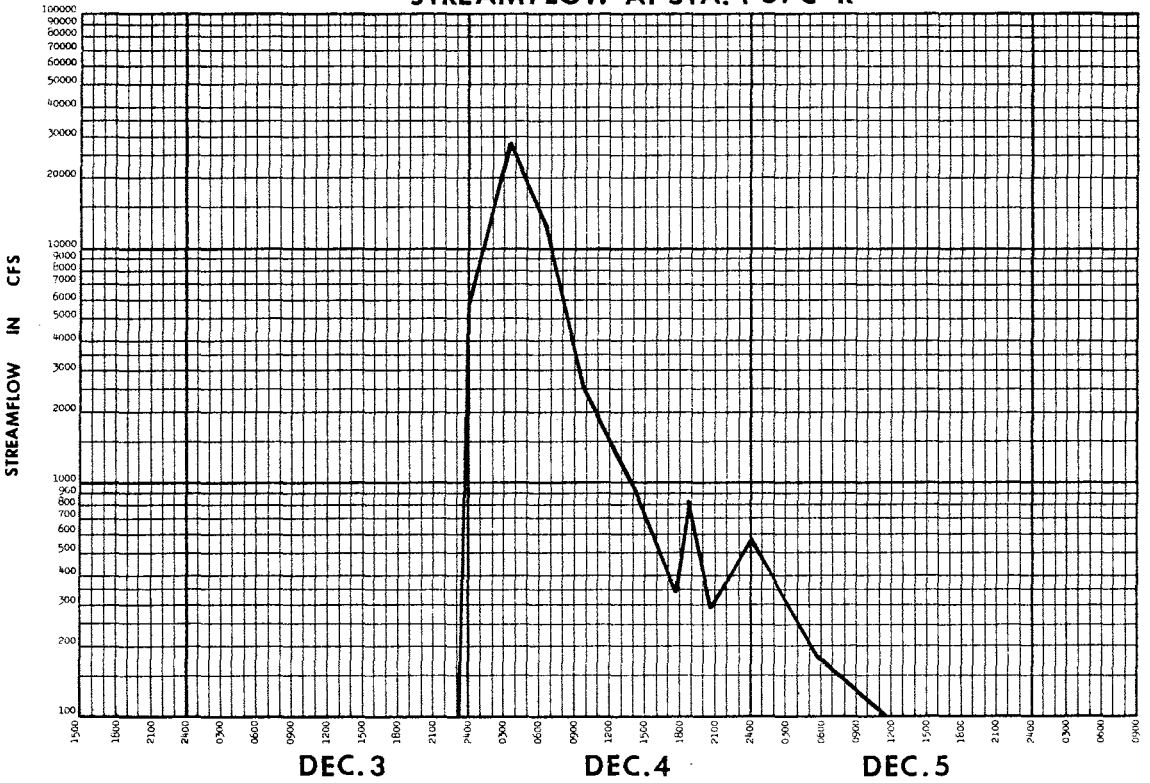
RAINFALL AT STA. 465B

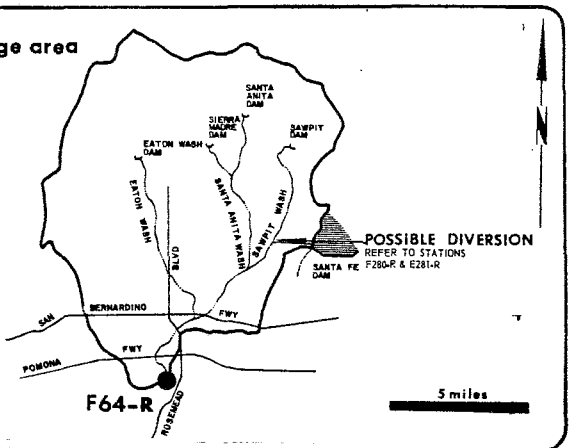


STREAMFLOW AT STA. F57C-R



STATION NO. F 64-R
RIO HONDO
above Mission Bridge

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 115 square miles (excludes area above Santa Fe Dam)

LOCATION – 1,000 feet above San Gabriel Boulevard, west of Rosemead Boulevard, 2.0 miles northeast of Montebello

REGULATION – partially regulated by Sierra Madre, Santa Anita, Sawpit, Eaton, and Santa Fe Dams and several debris basins.

CHANNEL – sand and silt, natural in section

CONTROL – none

LENGTH OF RECORD – July 1, 1928 to date

REMARKS – subject to diversions; water purchased from the MWD passes this station for spreading in the coastal basin

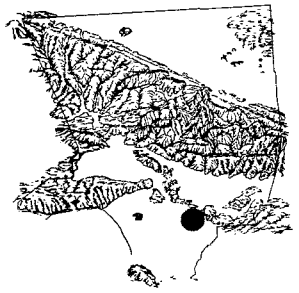
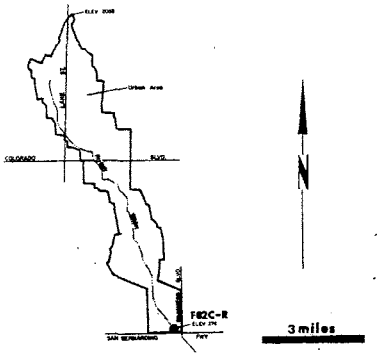
STATION NO. F 82C-R
RUBIO WASH
at Glendon Wash



drainage area



RECORDER - 15 MINUTE PUNCHED TAPE

METHOD OF MEASUREMENT - LOW FLOWS MEASURED BY WADING. HIGH FLOWS MEASURED FROM FOOTBRIDGE AT STATION.

DRAINAGE AREA - 10.9 SQUARE MILES

LOCATION - ON THE EAST SIDE OF CHANNEL, 10 FEET SOUTH OF THE WESTERLY EXTENSION OF GLENDON WAY, ROSEMEAD

REGULATION - FLOW PARTLY REGULATED BY LAS FLORES AND RUBIO DEBRIS BASINS

CHANNEL - RECTANGULAR CONCRETE

CONTROL - CHANNEL FORMS CONTROL

LENGTH OF RECORD - SEE STATION SUMMARY

cross section

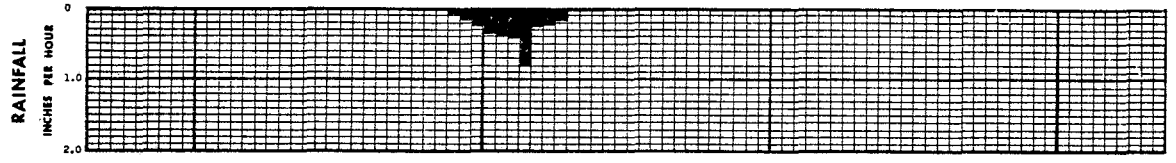
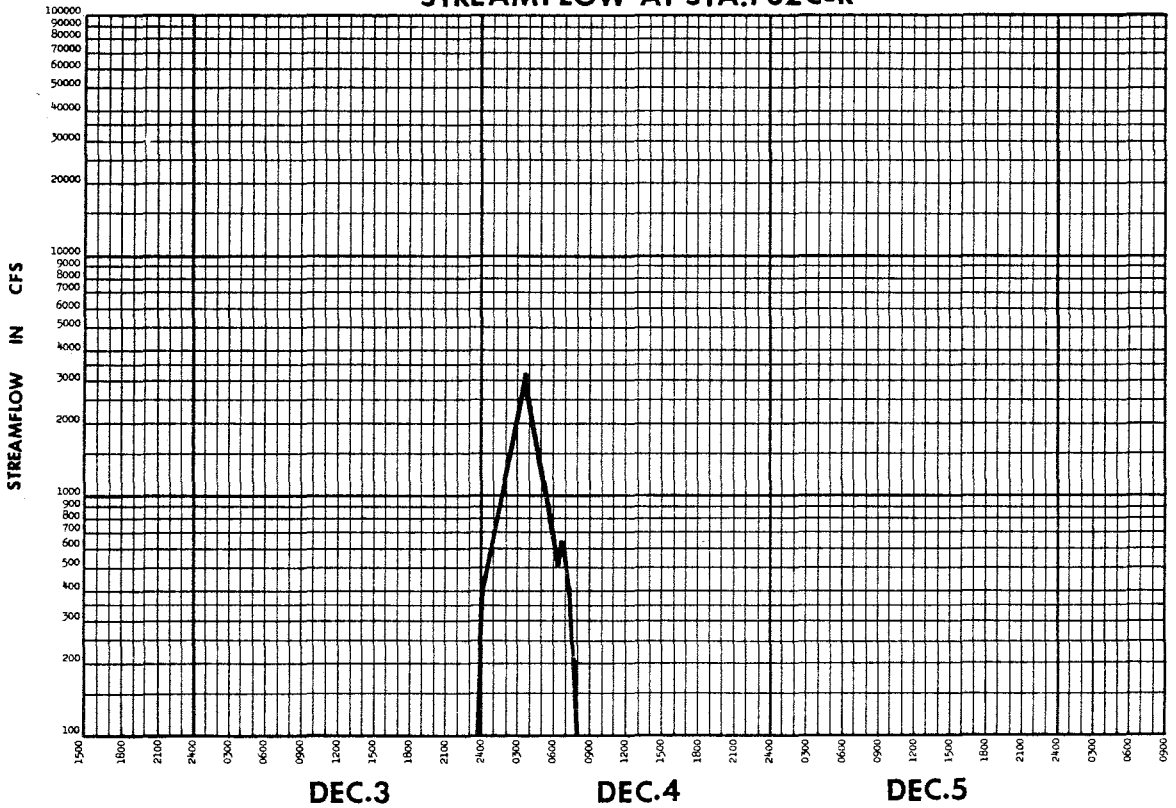
RAINFALL AT STA. 303F

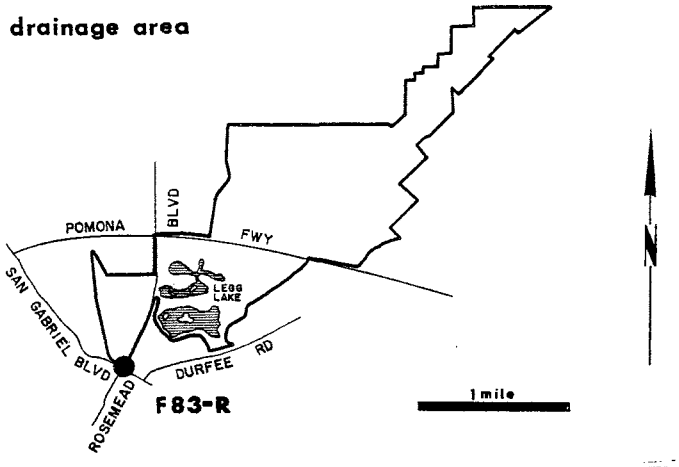


STREAMFLOW AT STA. F82C-R



STATION NO. F 83-R
MISSION CREEK
at San Gabriel Boulevard

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from bridge

DRAINAGE AREA – 4.2 square miles

LOCATION – upstream of San Gabriel Boulevard, 0.2 miles northeast of Montebello

REGULATION – partially regulated by outflow from Legg Lake

CHANNEL – sand with brush and fences, natural in section

CONTROL – channel forms control

LENGTH OF RECORD – June 14, 1930, to date

REMARKS – nearly all flows originate in rising water

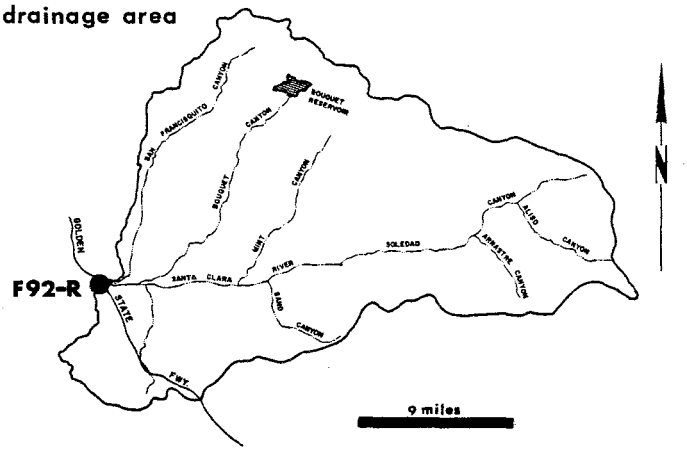
STATION NO. F92-R
SANTA CLARA RIVER
below Highway 5

drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS - wading or from cable car

DRAINAGE AREA - 410.4 square miles

LOCATION - downstream side of Old Highway bridge, 3.0 miles west of Saugus

REGULATION - partially regulated by Bouquet Canyon and Dry Canyon Reservoirs

CHANNEL - sand and gravel with brush, natural section

CONTROL - none

LENGTH OF RECORD -
at Station F92-R, January 18, 1930 to March 28, 1938
September 24, 1956 to date
at Station F92B-R, October 1, 1938 to September 24, 1956

REMARKS - subject to diversions for irrigation

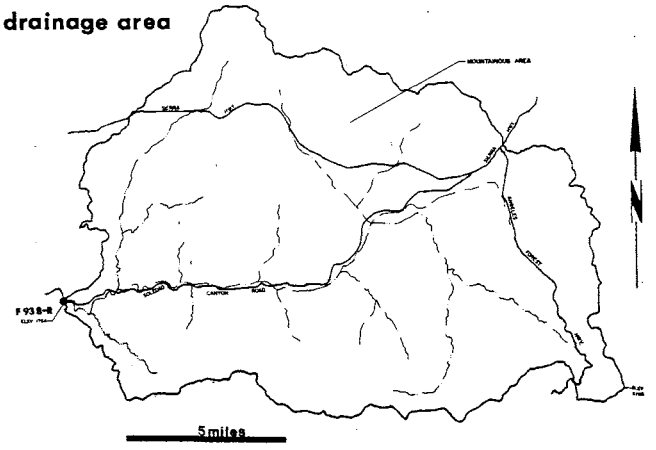
STATION NO. F93B-R
SANTA CLARA RIVER above Lang Station at R.R. Bridge

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading

DRAINAGE AREA – 157.3 square miles

LOCATION – 0.7 mile above Lang Railroad Station, at railroad bridge, 15.0 miles northeast of Newhall

REGULATION – none

CHANNEL – sand, gravel, and rock, natural section

CONTROL – none

LENGTH OF RECORD – April 3, 1970, to date

REMARKS – Station F93-R, located 0.25 mile below Station F93B-R, is maintained for high flows. It has daily records available for the Seasons 1949-1968, as shown in the summary.

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 103.0 square miles

LOCATION – 0.2± mile downstream of Cold Creek, 6.0 miles southwest of Calabasas

REGULATION – Lake Sherwood Dam, Lake Eleanor Dam, Malibu Lake Dam, and Crag's Dam. Other small recreational dams affect low summer flows.

CHANNEL – coarse sand and gravel, lined with trees and brush, natural in section

CONTROL – concrete stabilizer

LENGTH OF RECORD – January 17, 1931, to date

REMARKS – cableway washed out on January 25, 1969; no high flow measurements since that date

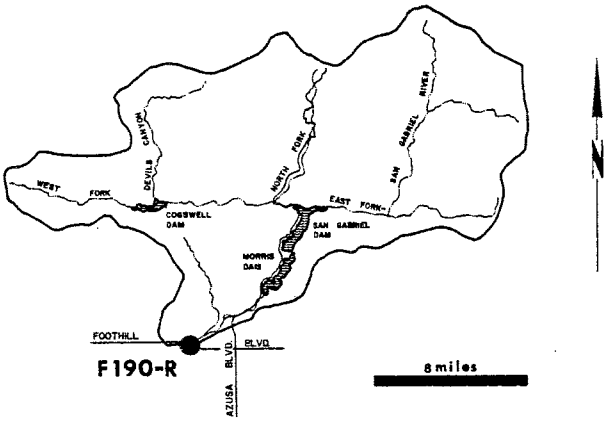
STATION NO. F 190 - R
SAN GABRIEL RIVER
at Foothill Boulevard

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 230.0 square miles

LOCATION – downstream side of Foothill Boulevard bridge, 2.0 miles west of Azusa

REGULATION – partially regulated by Cogswell, San Gabriel, and Morris Dams

CHANNEL – sand, gravel and rock, tropezoidal section with soft bottom

CONTROL – gunited rock stabilizers

LENGTH OF RECORD – February 22, 1932, to date

REMARKS - flows may include imported water originating at the Metropolitan Water District outlet below Morris Dam.

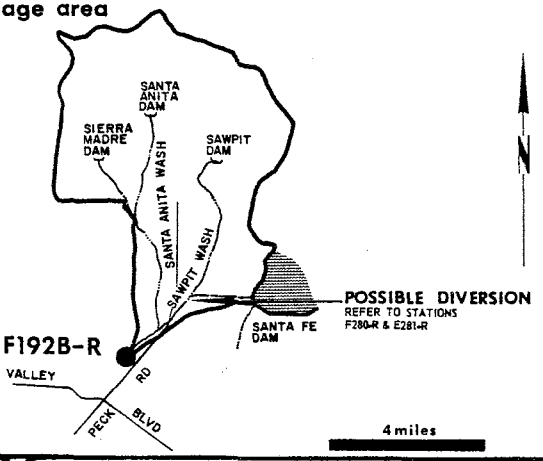
STATION NO. F 192B - R
RIO HONDO
below Lower Azusa Road

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading

DRAINAGE AREA – 40.9 square miles (excludes area above Santa Fe Dam)

LOCATION – 300.0 feet downstream from Lower Azusa Road, 1.5 miles north of El Monte

REGULATION – partially regulated by Sierra Madre Dam, Santa Anita Dam, Sawpit Dam, Santa Fe Dam, Peck Pit, Buena Vista Pit, and several debris basins.

CHANNEL – concrete, trapezoidal in section

CONTROL – channel forms control

LENGTH OF RECORD – at Station F192-R, February 22, 1932, to May 7, 1958 at Station F192B-R, May 7, 1958, to date

REMARKS – subject to diversions from Monrovia, Sawpit, and Little Santa Anita Creeks. Also from the San Gabriel River below Santa Fe Dam; and for irrigation and spreading.

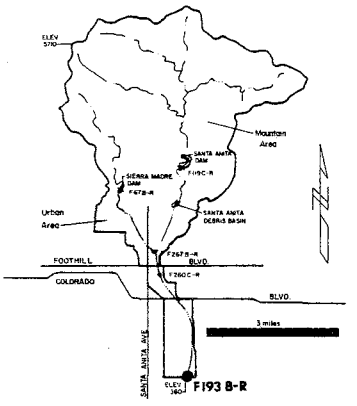
B = RECORD BEGAN AT B LOCATION 12-18-58.

STATION NO. F 193 B-R
SANTA ANITA WASH
at Longden Avenue

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from bridge

DRAINAGE AREA – 18.8 square miles

LOCATION – 30.0 feet above Longden Avenue, 1.5 miles south of Arcadia

REGULATION – regulated by Santa Anita and Sierra Madre Dams, and Santa Anita Debris Basin

CHANNEL – concrete, rectangular section

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F193-R, April 25, 1932, to March 1, 1938
at Station F193B-R, January 5, 1960, to date

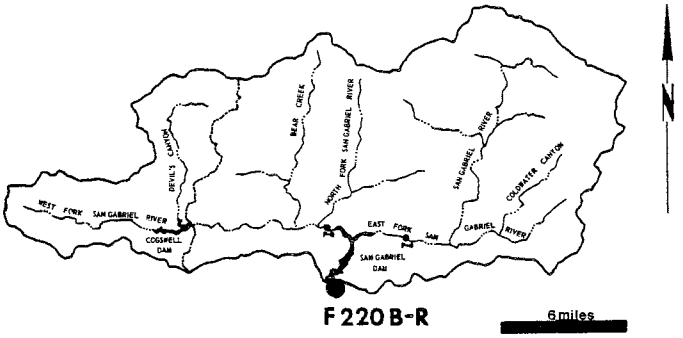
STATION NO. F 220B-R
SAN GABRIEL-AZUSA CONDUIT
at 10 ft. Weir below San Gab. Dam

drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS - weir formula with gage height observation

DRAINAGE AREA - none

LOCATION - on the concrete conduit which diverts from San Gabriel Dam, 160 feet below the dam

REGULATION - regulated by San Gabriel dam

CHANNEL - rectangular in section

CONTROL - 10-foot concrete weir

LENGTH - February 26, 1933, to date

REMARKS - approximate capacity 95 second-feet

cross-section

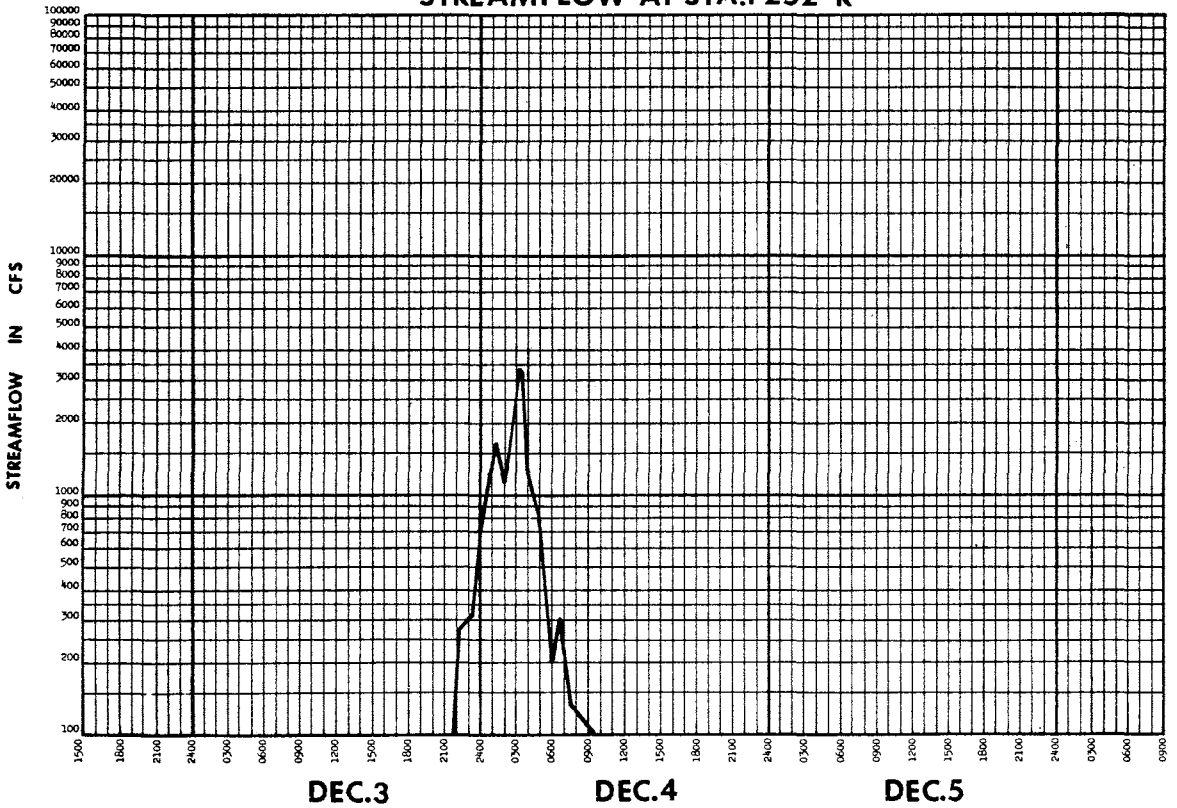
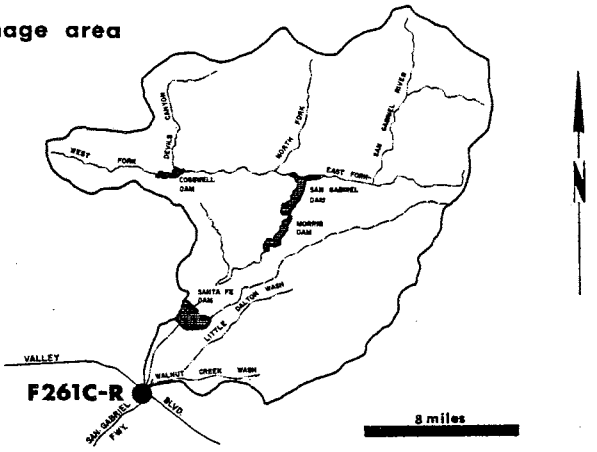
RAINFALL AT STA. 280B

STREAMFLOW AT STA. F252-R



STATION NO. F 261C-R
SAN GABRIEL RIVER
below Valley Boulevard

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading

DRAINAGE AREA – 118.0 square miles (excludes area above Santa Fe Dam)

LOCATION – 1,150.0 feet below Valley Boulevard, 2.5 miles east of El Monte

REGULATION - partly regulated by Santa Fe, Big Dalton, Puddingstone Diversion, and Puddingstone Dams.

CHANNEL – sand and gravel bottom with rip-rap side slopes; trapezoidal section

CONTROL – concrete stabilizer with low-flow notch

LENGTH OF RECORD –
at Station F261-R, March 11, 1937, to September 30, 1941
at Station F261B-R, October 1, 1941, to April 23, 1946
at Station F261C-R, November 29, 1960, to date

REMARKS - flows may include imported water originating at Metropolitan Water District outlets at San Dimas Canyon and below San Bernardino Road.

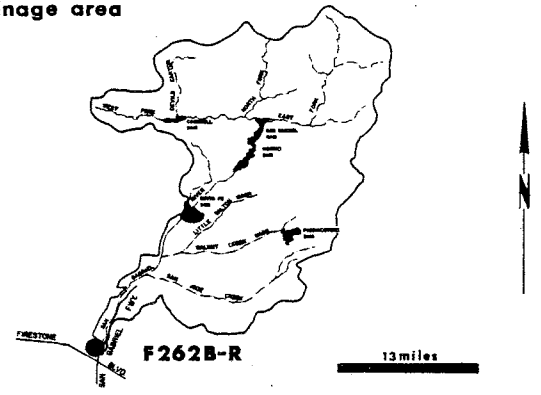
STATION NO. F 262B-R
SAN GABRIEL RIVER
above Florence Avenue

drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS - wading or from cable car

DRAINAGE AREA - 215.8 square miles (excludes area above Santa Fe Dam)

LOCATION - 1,400 feet above Florence Avenue, 2.0 miles east of Downey

REGULATION - partially regulated by Cogswell, San Gabriel, Morris, Santa Fe, Big Dalton, San Dimas, Puddingstone Diversion, Puddingstone, Live Oak, Thompson Creek and Whittier Narrows Dams, several debris basins, MWD outlets, and several spreading grounds

CHANNEL - sand bottom with rip-rap side slopes, trapezoidal section

CONTROL - concrete stabilizer

LENGTH OF RECORD - at Station F267-R, February 27, 1937 to September 30, 1967 at Station F262B-R, August 6, 1968, to date

REMARKS - no record during 1967-1968 season due to channel construction

cross-section

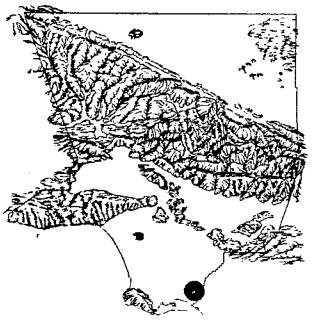
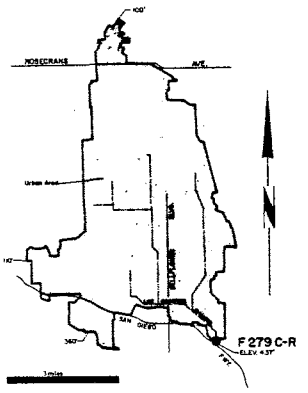
STATION NO. F 279C-R
LOS CERRITOS CHANNEL
at Stearns Street



drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from bridge

DRAINAGE AREA – 25.6 square miles

LOCATION – upstream of Stearns Street, Long Beach

REGULATION – none

CHANNEL – concrete, trapezoidal in section

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F279-R, November 23, 1942, to January 1, 1949
at Station F279B-R, January 1, 1949, to May 26, 1955
at Station F279C-R, October 26, 1955, to date

REMARKS – station not in service May 26, 1955, to October 26, 1955, due to channel construction

cross-section

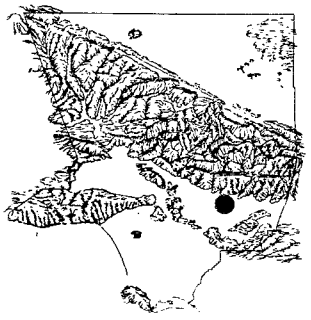
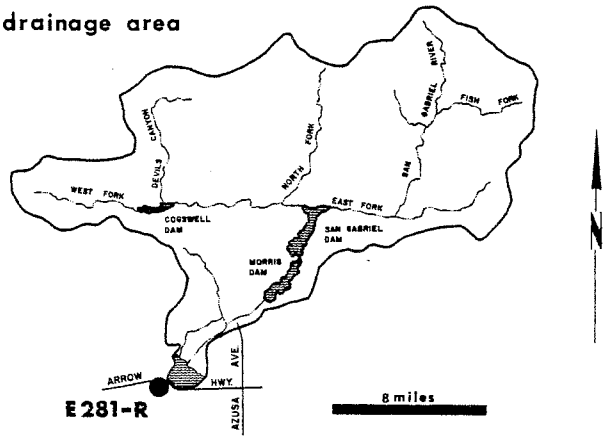
STATION NO. E 281 - R
SAN GABRIEL RIVER
below Santa Fe Dam



drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS - wading or from cable car

DRAINAGE AREA - 236.0 square miles (revised)

LOCATION - 1.7 miles north of Baldwin Park

REGULATION - regulated by Santa Fe Dam

CHANNEL - Stilling basin, located in the outlet channel immediately below Santa Fe Dam

CONTROL - 195.0-foot-wide concrete overflow section to the San Gabriel River and five gated openings to the Rio Hondo diversion channel

LENGTH OF RECORD - February 9, 1943, to date

REMARKS - Station operated by USGS. Outflow from Santa Fe Dam may be diverted through Santa Fe Diversion Channel. Refer to Station 280.

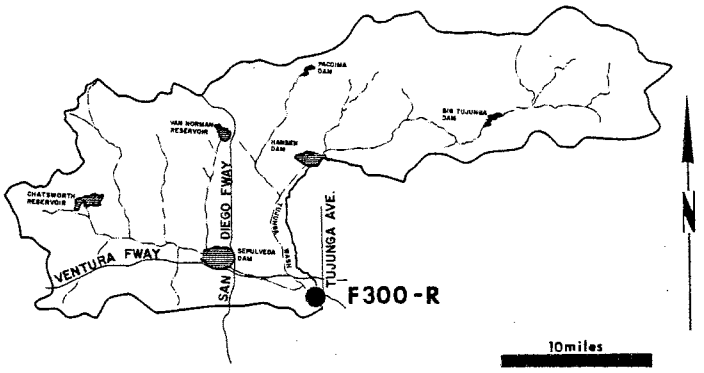
STATION NO. F 300 - R
LOS ANGELES RIVER
at Tujunga Avenue

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 401.0 square miles

LOCATION – 200.0 feet above Tujunga Avenue bridge Studio City

REGULATION – flow regulated by Sepulveda, Big Tujunga, Hansen, and Pacoima Dams, Lopez Debris Dam, and Project No. 85 Diversion

CHANNEL – concrete, rectangular section, 120 feet wide by 19 feet deep

CONTROL – channel forms control

LENGTH OF RECORD – May 8, 1950, to date

REMARKS – subject to diversions at mouth of Big Tujunga and Pacoima Canyons for irrigation; at Big Tujunga, Branford, Hansen, and Pacoima Spreading Grounds

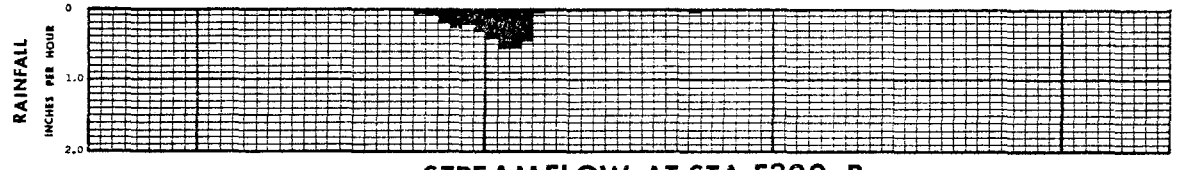
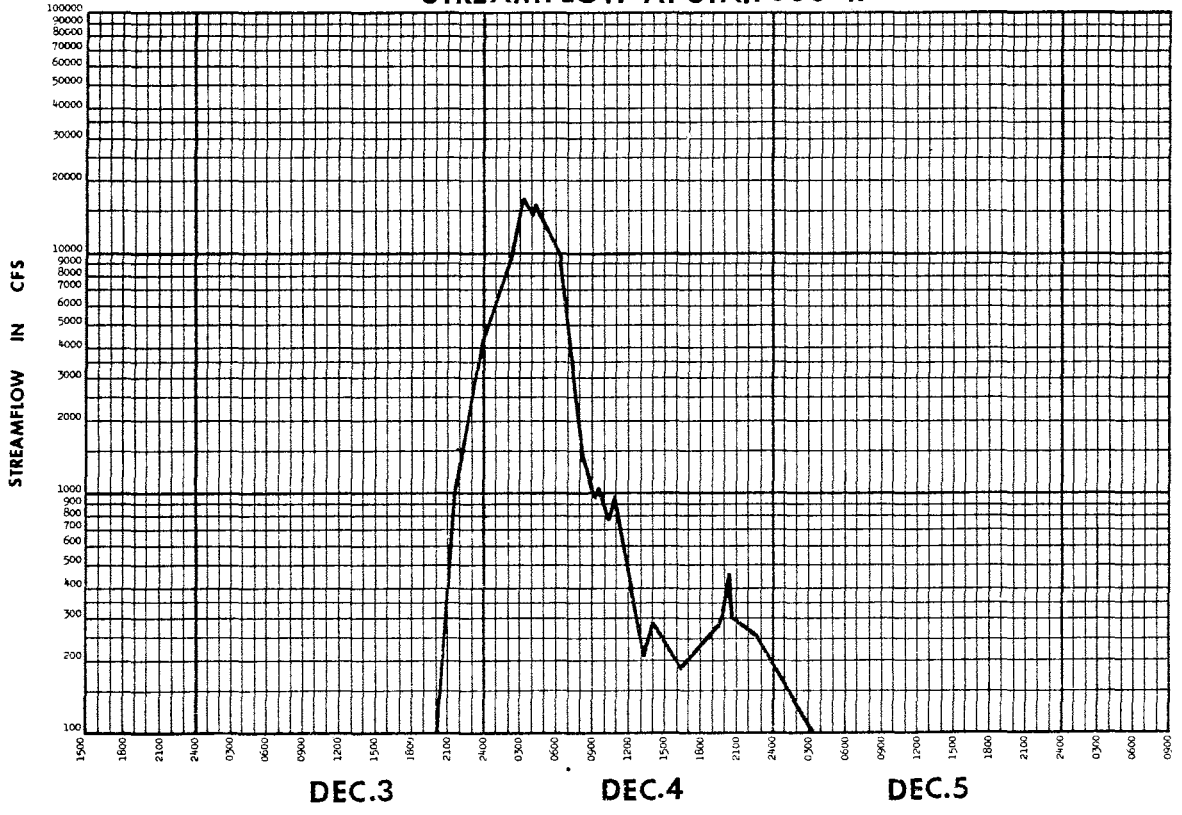
RAINFALL AT STA.465B

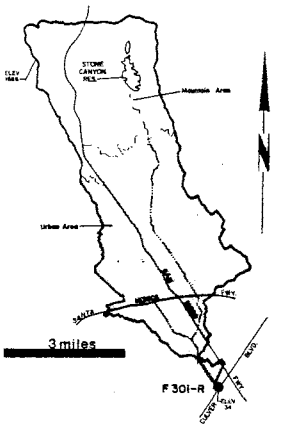


STREAMFLOW AT STA.F300-R



STATION NO. F301-R
SAWTELLE - WESTWOOD CHANNEL
above Culver Boulevard

drainage area



RECORDER - 15 MINUTE PUNCHED TAPE
METHOD OF MEASUREMENT - LOW FLOWS MEASURED BY WADING. HIGH FLOWS MEASURED FROM FOOTBRIDGE AT STATION.
DRAINAGE AREA - 22.9A SQUARE MILES
LOCATION - ON THE SOUTH CHANNEL WALL, 141 FEET ABOVE CULVER BOULEVARD BRIDGE ABOUT ONE AND ONE HALF MILES SOUTHWEST OF CULVER CITY.
REGULATION - STONE CANYON RESERVOIR, SOUTHERN CALIFORNIA WATER COMPANY SPILLS FLOW UP TO 5.0 SECOND-FEET INTO SAWTELLE - WESTWOOD CHANNEL ABOVE CHARNOCK ROAD FOR SHORT PERIODS NEARLY EVERY DAY
CHANNEL - RECTANGULAR CONCRETE CHANNEL 40 FEET WIDE AND 13 FEET DEEP.
CONTROL - CHANNEL FORMS CONTROL
LENGTH OF RECORD - SEE STATION SUMMARY

cross-section

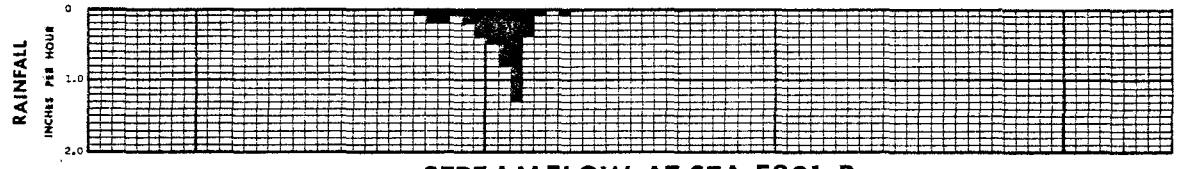
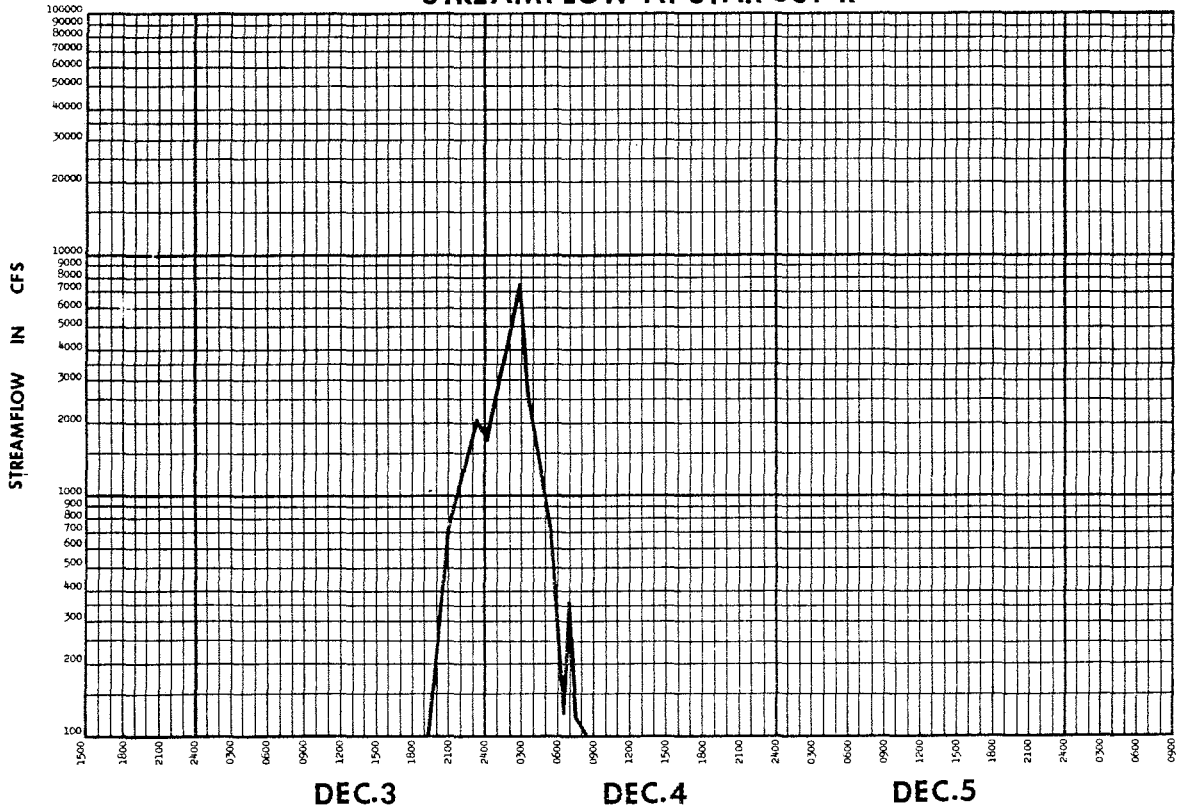
RAINFALL AT STA.10A

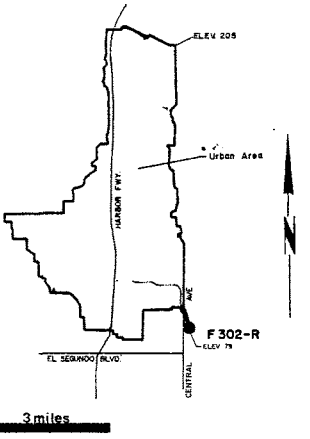


STREAMFLOW AT STA.F301-R



STATION NO. F302-R
COMPTON CREEK
at 120TH Street

drainage area



RECORDER - 15 MINUTE PUNCHED TAPE

METHOD OF MEASUREMENT - LOW FLOWS MEASURED BY WADING. HIGH FLOWS MEASURED FROM UPSTREAM SIDE OF 120 TH STREET BRIDGE.

DRAINAGE AREA - 14.5 SQUARE MILES

LOCATION - ON THE WEST BANK OF COMPTON CREEK 192 FEET UPSTREAM FROM CENTERLINE OF 120 TH STREET, WILLOWBROOK.

REGULATION - NONE

CHANNEL - CONCRETE, 48 FEET WIDE AND 10 FEET DEEP.

CONTROL - CHANNEL FORMS CONTROL

LENGTH OF RECORD - JANUARY 29, 1951 TO DATE

cross section

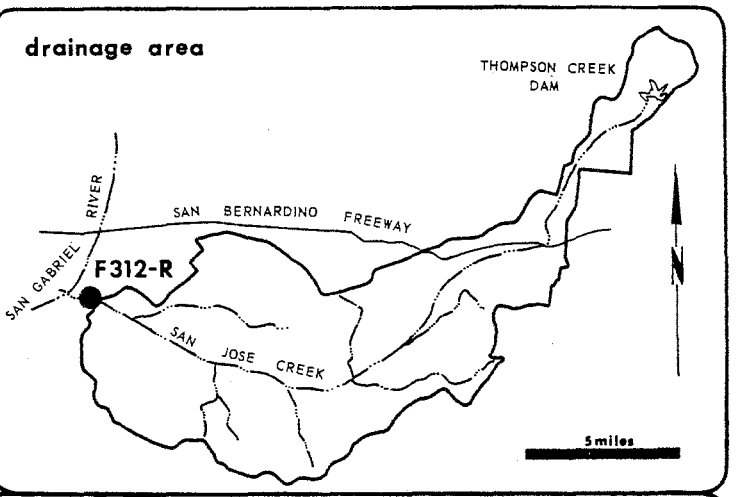
STATION NO. F 312 - R
SAN JOSE CHANNEL
above Workman Mill Road

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 83.4 square miles

LOCATION – 1,650 feet above Workman Mill Road, 3.0 miles southeast of El Monte

REGULATION – partially regulated by Thompson Creek Dam and Pomona Sewage Treatment Plant

CHANNEL – grouted rip-rap side slopes with natural bottom, trapezoidal section

CONTROL – rock stabilizer

LENGTH OF RECORD – September 13, 1955, to date

cross-section

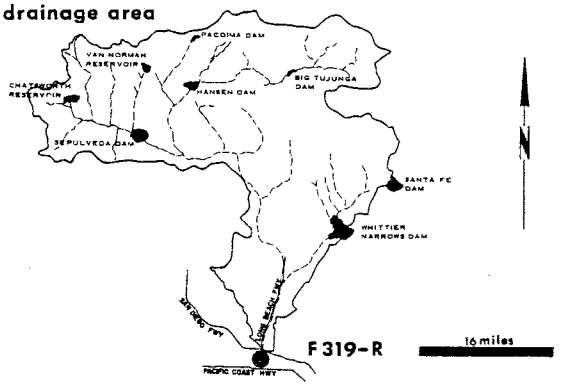
M = RECORDS MISSING
A = PRIOR TO 1956, RECORDS WERE OBTAINED AT STATION F104-R, ELLIS LANE, FROM OCTOBER 1, 1930 TO DECEMBER 27, 1930; AT STATION F104B-R, BROADWAY, FROM DECEMBER 28, 1930 TO NOVEMBER 10, 1931; AT STATION F104-R, ELLIS LANE, FROM NOVEMBER 10, 1931 TO MAY 4, 1955 (REMOVED FOR CHANNEL CONSTRUCTION). RECORDS BEGAN AT STATION F318-R ON FEBRUARY 23, 1956

STATION NO. F 319-R
LOS ANGELES RIVER
below Wardlow Road

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 815.0 square miles (excludes area above Santa Fe Dam)

LOCATION – 900.0 feet below Wardlow Road, Long Beach

REGULATION – flow is subject to the same regulation as Stations F34D-R and P45B-R.
Diversion - flows diverted to Dominguez Gap Spreading Grounds

CHANNEL – trapezoidal, concrete, 302.0 feet wide at bottom with 2.25:1 side slopes. Low flow channel 28.0 feet wide by 1.0 foot deep in center of channel

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F180-R, October 31, 1931, to January 13, 1956
at Station F319-R, January 13, 1956, to date

REMARKS – prior to 1931, see Station F36-R

cross-section

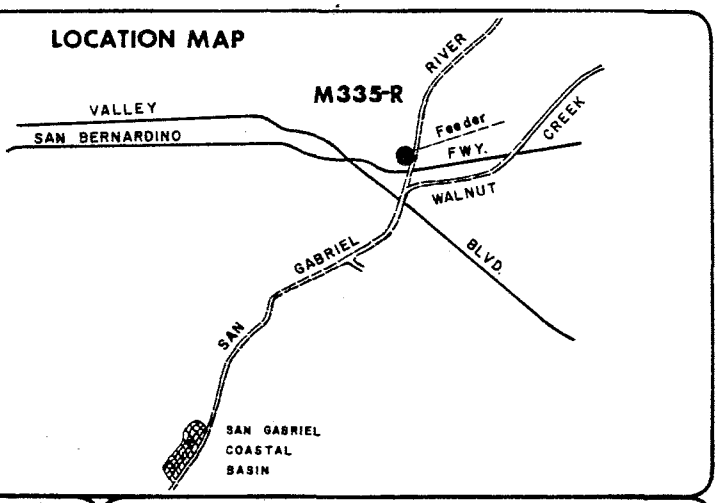
STATION NO. M335-R
SAN GABRIEL-MWD OUTLET BELOW RAMONA BOULEVARD



LOCATION: Lat. 34°04'34", Long. 117°59'56" on outlet of The Metropolitan Water Department's middle feeder, near the left (east) bank of the river, about 400 feet south of Ramona Blvd. and 350 feet west of Rivergrade Road.

CHANNEL AND CONTROL: A 73-inch diameter orifice plate.

DISCHARGE MEASUREMENTS: All flows measured by orifice meter with totalizer beginning December 21, 1960.

RECORDER: A weekly Venturi recorder.

RECORDS AVAILABLE: At Station F 335-R, November 30, 1957 to April 13, 1960; at Station M335-R, December 17, 1960 to present.

OPERATION: Located, constructed and operated by The Metropolitan Water District in cooperation with the Los Angeles County Flood Control District. This station is operated solely for the purpose of measuring the delivery of Colorado River water by The Metropolitan Water District to the San Gabriel River.

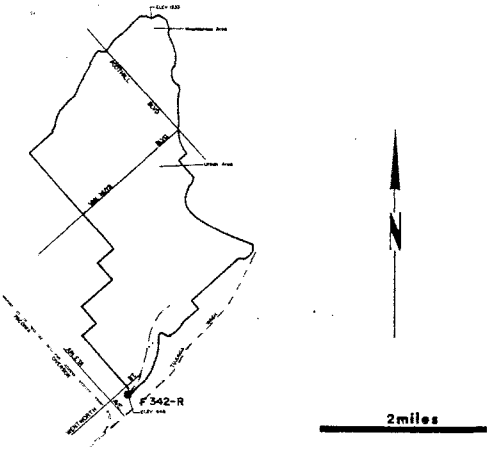
STATION NO. F342-R
BRANFORD STREET CHANNEL
below Sharp Avenue

drainage area



RECORDER - 15 MINUTE PUNCHED TAPE
METHOD OF MEASUREMENTS - LOW FLOWS MEASURED BY WADING. HIGH FLOWS MEASURED BY FLOATS.
DRAINAGE AREA - 5.01 SQUARE MILES
LOCATION - ON THE SOUTH BANK OF CHANNEL, 125 FEET DOWNSTREAM FROM SHARP AVENUE, ABOUT 3.6 MILES SOUTH OF SAN FERNANDO.
REGULATION - FLOW FROM LOPEZ CREEK IS DIVERTED TO HANSEN DAM AT THE MOUTH OF LOPEZ CANYON
CHANNEL - TRAPEZOIDAL 10 FEET WIDE AT BOTTOM AND 7.5 FEET DEEP WITH 1 1/2 TO 1 SIDE SLOPES.
CONTROL - CHANNEL FORMS CONTROL
LENGTH OF RECORD - JANUARY 12, 1962 TO DATE.

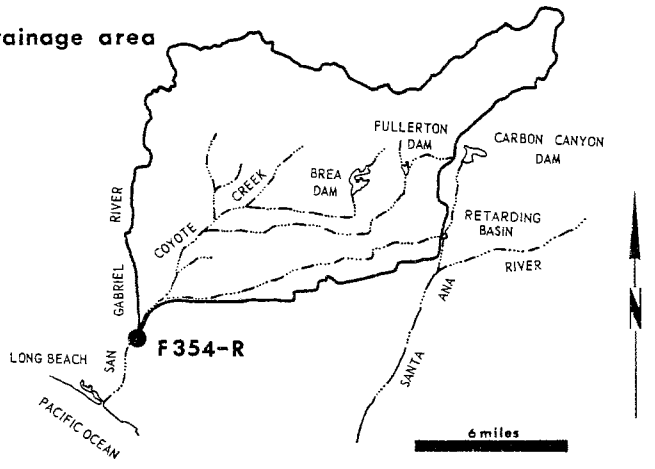
A = RECORD BEGAN AT F350-R DECEMBER 26, 1961. RECORDS ALSO AVAILABLE AT STATION F149-R, DEVONSHIRE STREET, NOVEMBER 9, 1939 TO DECEMBER 26, 1961. RECORDS FOR WATER YEARS 1956-61 WERE NOT COMPUTED BECAUSE OF EXTREME SILTING CONDITIONS.

STATION NO. F 354 - R
COYOTE CREEK
below Spring Street

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 185.0 square miles

LOCATION – 241.0 feet below Spring Street, 7.5 miles northeast of Long Beach

REGULATION – partially regulated by Fullerton Dam, Brea Dam, and Carbon Canyon Dam

CHANNEL – concrete, trapezoidal in section

CONTROL – channel forms control

LENGTH OF RECORD – December 17, 1963, to date

REMARKS – previous gaging stations for record corelation:
Station F41-S, December 1, 1928, to January 14, 1930
Station F41-R, January 14, 1930, to October 30, 1936
Station F41B-R, October 30, 1936, to February 17, 1937
Station F41C-R, February 18, 1937, to February 8, 1956
Station F320-R, February 9, 1956, to July, 2, 1965

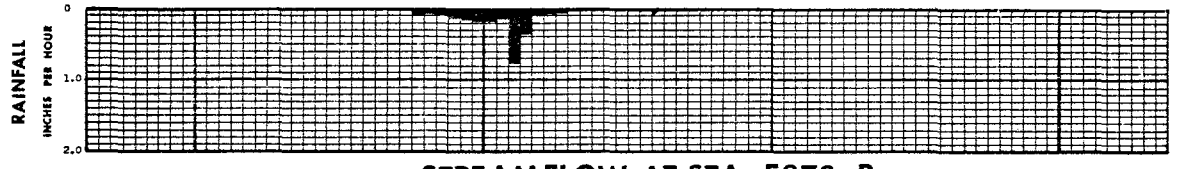
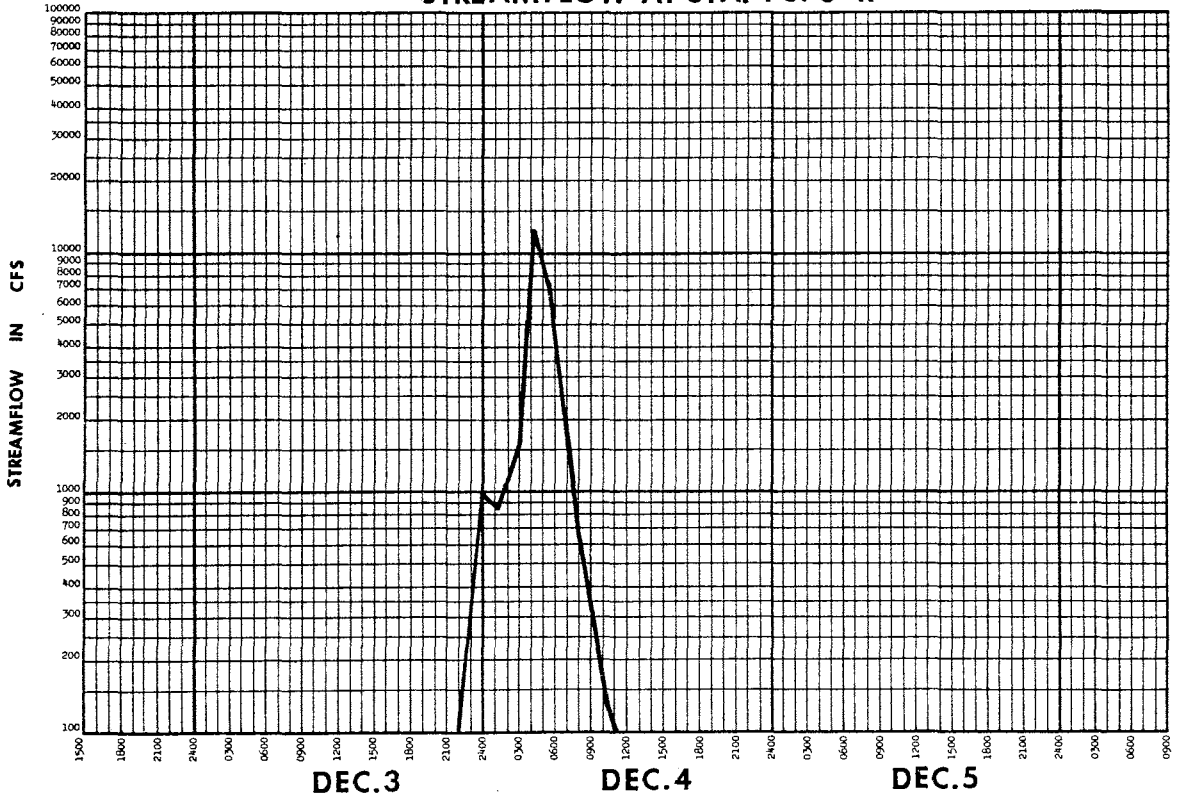
RAINFALL AT STA. 734

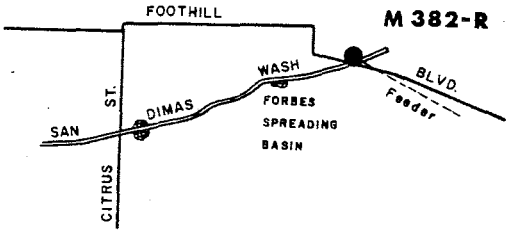


STREAMFLOW AT STA. F378-R



STATION NO. M382-R
SAN DIMAS WASH-MWD OUTLET above Foothill Boulevard

LOCATION MAP



LOCATION: Lat. 34°07'34", Long. 117°47'41", on the right, (west) bank at the inlet structure of the paved channel and about 1,250 feet above Foothill Boulevard; about 2 miles north of San Dimas. Elevation of outlet approximately 1,078.5 feet.

RECORDER: Continuous totalizing recorder with Venturi control.

REGULATION: Entirely regulated by gated outlet on The Metropolitan Water District upper feeder.

RECORDS AVAILABLE: October 29, 1968 to present.

OPERATION: Located, constructed, and operated by The Metropolitan Water District in cooperation with the Los Angeles County Flood Control District.

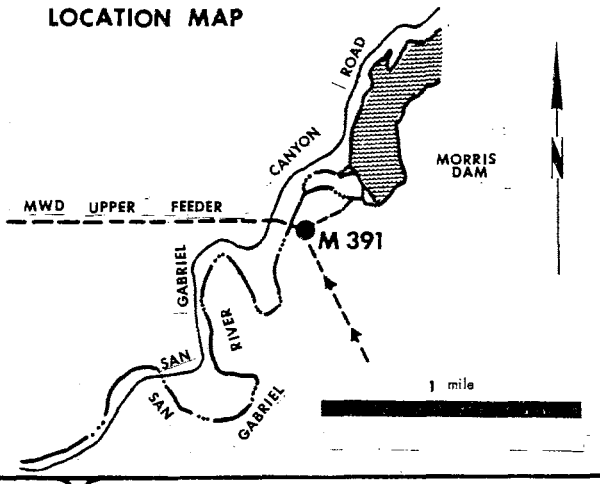
1/ During a construction project at M382-R deliveries were made at a temporary MWD outlet on Thompson Creek, October 11, 1974 through May 1, 1975.

STATION NO. M391
SAN GABRIEL RIVER
below Morris Dam



LOCATION: Lat. 34° 10' 25", Long. 117° 53' 03", on the east bank of the San Gabriel River about 1400 feet below Morris Dam; about 3.5 miles northeast of Azusa. Elevation of outlet approximately 931 feet.

RECORDER: None. Data is computed by taking the recorded total flow at the Live Oak outlet less the total release to the La Verne pump plant and M382-R.

REGULATION: Entirely regulated by gated outlet on the Metropolitan Water District upper feeder.

RECORDS AVAILABLE: February 8, 1972 to present.

OPERATION: Located, constructed and operated by the Metropolitan Water District in cooperation with the Los Angeles County Flood Control District. This outlet is utilized for the delivery of Colorado River water to the San Gabriel River.

RISING WATER
at Whittier Narrows

The values of discharge summarized here are computed by means of interpolation between measured amounts. It has been necessary to estimate the quantity of rising water reaching Whittier Narrows during periods of high flow such as during storms. Beginning in 1954 the importation of Colorado River water for spreading created conditions which have made accurate measurements impossible to obtain. When these conditions prevail, estimates are made which are based on the nearest accurate values.

Rising water discharge is computed by the formula:

$$M = A + B - (C + D) + G + H - (I + J)$$

M = total rising water at Whittier Narrows.

A = computed flow of Mission Creek at San Gabriel Boulevard.

B = measured flow of Rio Hondo at maximum rising water.

C = measured flow of Rio Hondo above rising water, Station E326-R.

D = additional flow at various locations.

G = measured flow of San Gabriel River above Parkway Bridge, Station F86-S.

H = diversion above "G".

I = measured flow of San Gabriel River above rising water.

J = additional flow at various locations.

A graph has been included which shows the mean monthly rising water from January 1923 through the period of this report.

RESERVOIRS

Following the damaging floods of 1913-14 and 1915-16, Los Angeles County initiated a program of flood control and water conservation including the construction of 14 dams. These dams were operated by the District during the season covered by this report. In additon, five Corps of Engineers' dams and Morris Dam owned by The Metropolitan Water District were utilized to achieve flood control and water conservation. The Corps of Engineers' dams are: Hansen Dam on Tujunga Wash, Sepulveda Dam on the Los Angeles River, Santa Fe Dam on the San Gabriel River, and Whittier Narrows Dam on the San Gabriel River and Rio Hondo, and San Antonio Dam on San Antonio Creek.

OPERATION

The reservoirs are operated to control flood waters during storm periods. Post storm releases are made, when feasible, in amounts which can be conserved in spreading grounds and by natural channel percolation. Following the storm season, water is stored to provide streamflow during the dry summer months for recreation and water supply purposes.

RECORDS

The daily storage and flow records at 14 of the District reservoirs are summarized on the Dam Operation Record Sheets. The sheets show:

1. Reservoir water surface elevations based on the spillway datum. Elevations are obtained from water stage recorder graphs or interpolation from staff gage readings and recorded as of midnight of each day.

2. Storage in acre-feet based on the most recent topographic surveys.

3. Inflow in cubic feet per second. This is usually calculated from storage change and known outflow. When outflow is not known, the inflow may be determined from gaging station records or interpolated between measurements.

4. Outflow in cubic feet per second. These values are determined from gaging station records, known valve openings and rating curves, or from storage change and known inflow.

5. In some instances, total monthly and yearly evaporation and percolation losses have been computed and are indicated on the Dam Operation Records. Discrepancies between outflow and storage losses at certain dams are attributable to percolation and/or evaporation losses and are shown as total monthly and yearly losses. Total monthly evaporation losses are shown as determined from measurements made on floating or land evaporation pans. In those cases where no allowances were made for evaporation, the amounts are necessarily included in the flow values.

   Accuracy of the flow records computed from storage records is dependent on the frequency with which storage data are revised to keep in step with physical change in reservoirs.

   Recovery of storage capacity lost through sedimentation is accomplished through sluicing and excavation.

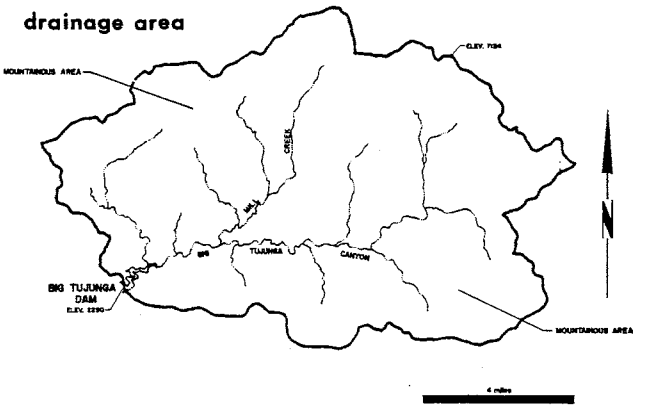
Max. Peak Outf. CFS from on to on

REMARKS: ( ) Indicates average for period
( ) Indicates evaporation losses.
There was a 7.1 A.F. gain in storage in August due to new storage table survey of 8-8-75.

BIG TUJUNGA DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started January 1930 - Completed July 1931

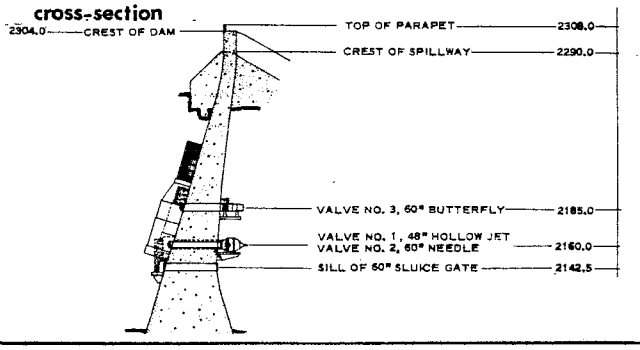
LOCATION -
Big Tujunga Canyon, 10.0 miles northeast of Sunland

DRAINAGE AREA - 82.3 square miles

CAPACITY - 6,027 acre-feet

SPILLWAY ELEVATION - 2,290.0 feet

cross-section



BIG TUJUNGA DAM

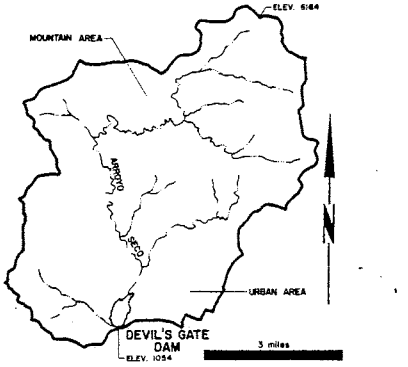
( ) Indicates evaporation and other losses.

DEVIL'S GATE DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started May 1919 - completed June 1920

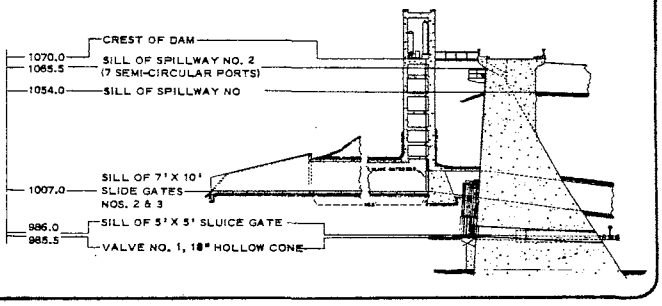
LOCATION -
On Arroyo Seco, northwest of Pasadena

DRAINAGE AREA - 31.9 square miles

CAPACITY - 1,928 acre-feet

SPILLWAY ELEVATION - 1,054.0 feet

cross-section



DEVILS GATE DAM

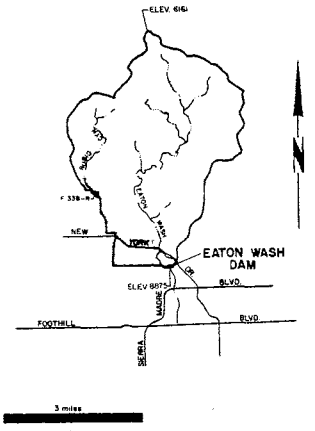
() Indicates percolation and other losses.

EATON WASH DAM AND RESERVOIR

drainage area



PURPOSE -
Debris Storage and Conservation

DATE CONSTRUCTED -
Started January 1936 - Completed February 1937

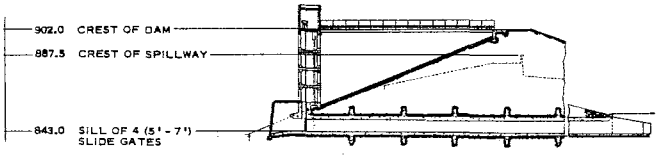
LOCATION -
Eaton Wash, northeast of Pasadena

DRAINAGE AREA - 12.4 square miles

CAPACITY - 879 acre-feet

SPILLWAY ELEVATION - 887.5 feet

cross-section



EATON DAM

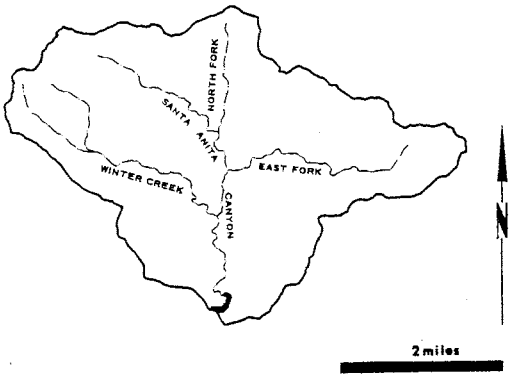
SANTA ANITA DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started October 1924 - Completed March 1927

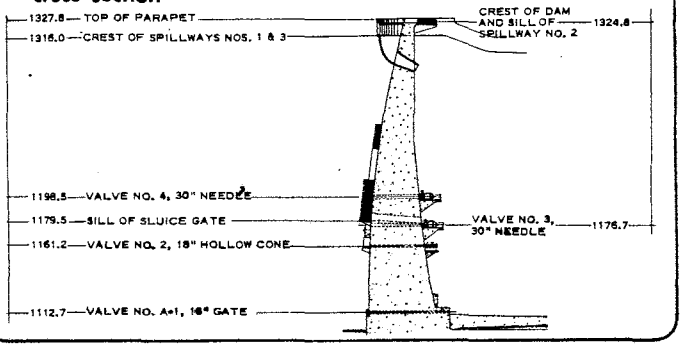
LOCATION - 2.5 miles north of Arcadia

DRAINAGE AREA - 10.8 square miles

CAPACITY - 836 acre-feet

SPILLWAY ELEVATION - 1,316.0 feet

cross-section



SANTA ANITA DAM

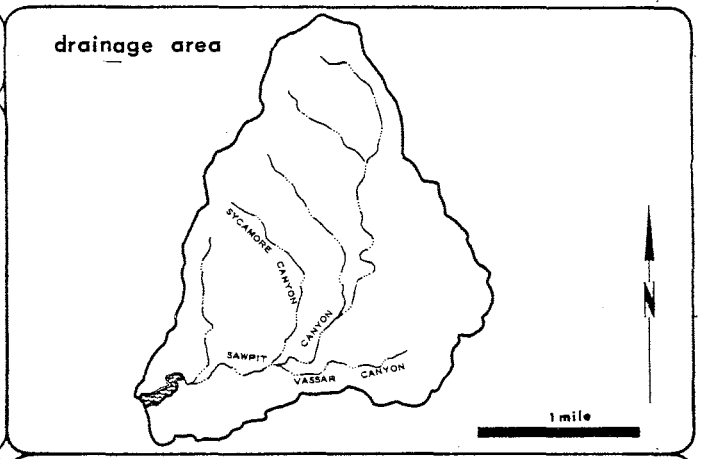
REMARKS: ( ) Indicates evaporation and other losses.

SAWPIT DAM AND RESERVOIR



PURPOSE -
Flood Control and Conservation

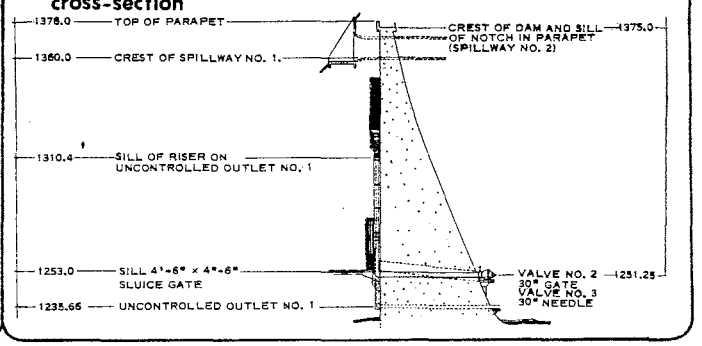
DATE CONSTRUCTED -
Started March 1926 - Completed June 1927

LOCATION - 2.0 miles north of Monrovia

DRAINAGE AREA - 3.2 square miles

CAPACITY - 391 acre-feet

SPILLWAY ELEVATION - 1,360.0 feet



SAWPIT DAM

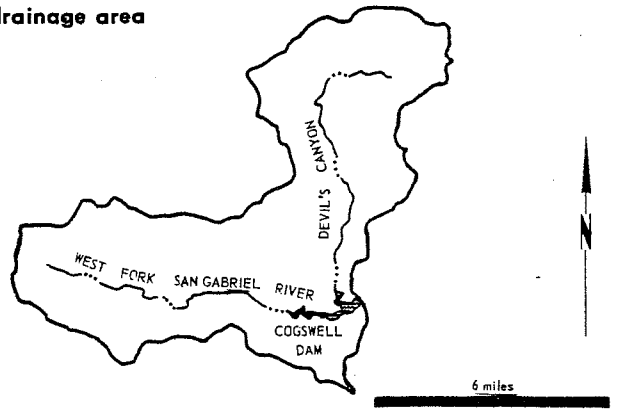
REMARKS:

COGSWELL DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control, Conservation, and Recreation

DATE CONSTRUCTED -
Started March 1932 - Completed April 1934

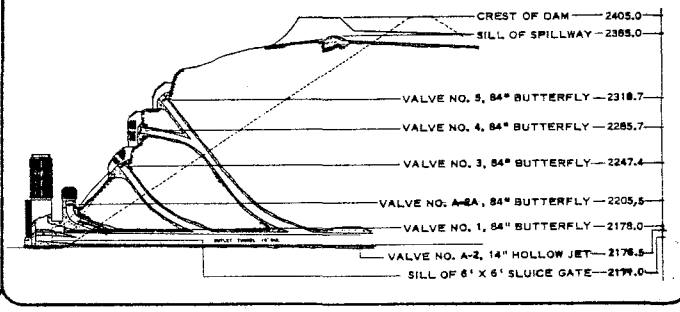
LOCATION - 22.0 miles north of Azusa

DRAINAGE AREA - 39.2 square miles

CAPACITY - 9,339 acre-feet

SPILLWAY ELEVATION - 2,385.0 feet

cross-section



COGSWELL DAM

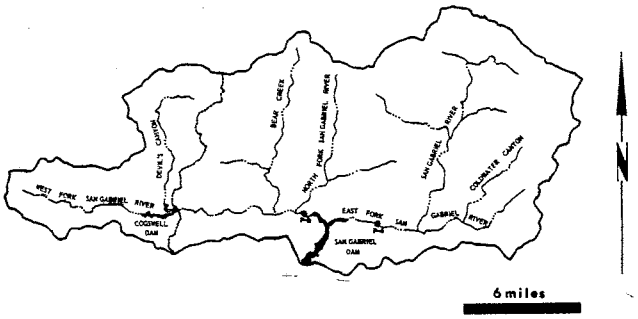
( ) Indicates evaporation losses

SAN GABRIEL DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started December 1932 - Completed July 1939

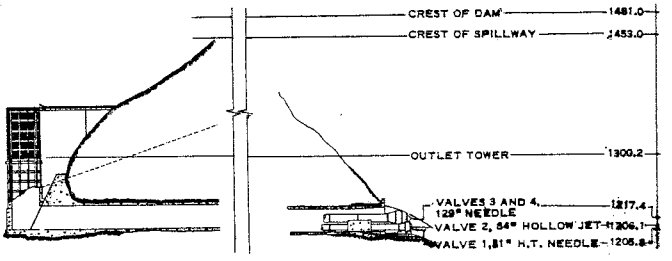
LOCATION -
San Gabriel Canyon, 7.5 miles north of Azusa

DRAINAGE AREA - 163.5 square miles (uncontrolled)
39.2 square miles (controlled)
Total 202.7 square miles
(includes Cogswell drainage)

CAPACITY - 41,549 acre-feet

SPILLWAY ELEVATION - 1,453 feet

cross-section



SAN GABRIEL DAM

LOS ANGELES COUNTY FLOOD CONTROL DISTRICT

DAM OPERATION RECORD

San Gabriel Dam

1974-75

GAGE HEIGHTS AND STORAGES ARE AS OF MIDNIGHT ON DAY SHOWN.

DRAINAGE AREA 202.7 SQ. MI.
CAPACITY OF RESERVOIR 46554 AC. FT.
@ SPILLWAY ELEVATION 1453 FT.
as of October 1973

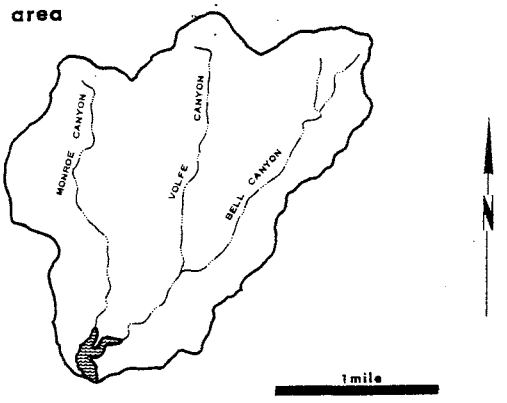
BIG DALTON DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started December 1927 - Completed August 1929

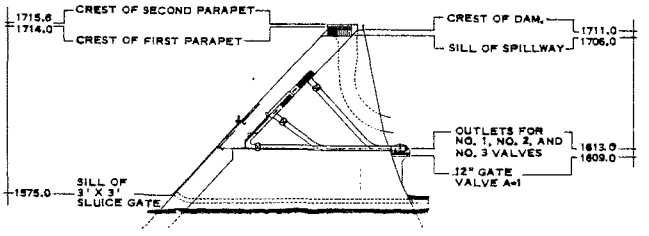
LOCATION -
Big Dalton Canyon, 4.0 miles northeast of Glendora

DRAINAGE AREA - 4.5 square miles

CAPACITY - 963 acre-feet

SPILLWAY ELEVATION - 1,706.0 feet

cross-section



BIG DALTON DAM

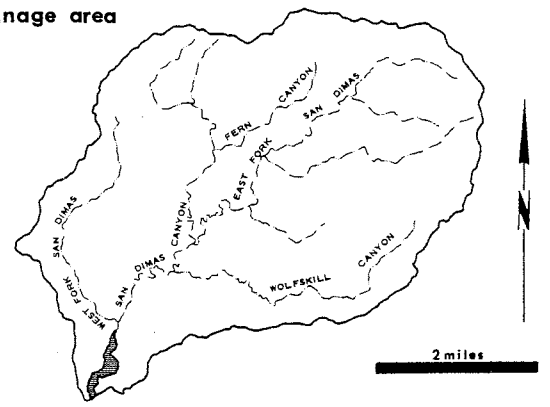
SAN DIMAS DAM
AND RESERVOIR



PURPOSE - Flood Control and Conservation

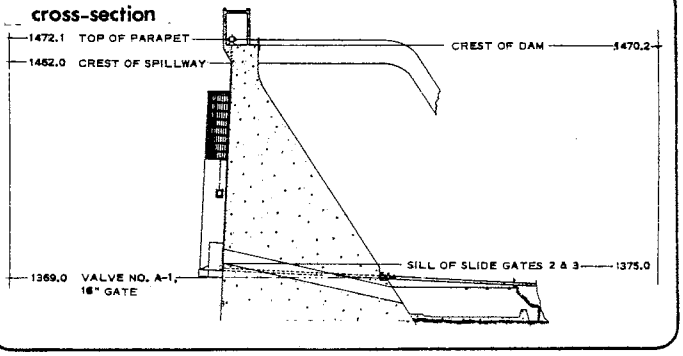
DATE CONSTRUCTED -
Started November 1920 - Completed September 1922

LOCATION – 3.0 miles northeast of San Dimas

DRAINAGE AREA - 16.2 square miles

CAPACITY - 1,515 acre-feet

SPILLWAY ELEVATION - 1,462.0 feet



SAN DIMAS DAM

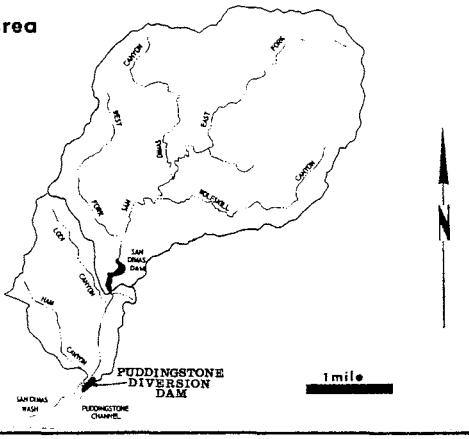
/ Indicates evaporation losses.

PUDDINGSTONE DIVERSION DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Diversion of flow and Conservation

DATE CONSTRUCTED -
Started September 1927 - Completed July 1928

LOCATION - 2.0 miles northeast of San Dimas

DRAINAGE AREA - 3.7 square miles (uncontrolled)
16.2 square miles (controlled)
Total 19.9 square miles

CAPACITY - 148 acre-feet

SPILLWAY ELEVATION - 1,152.0 feet

cross-section

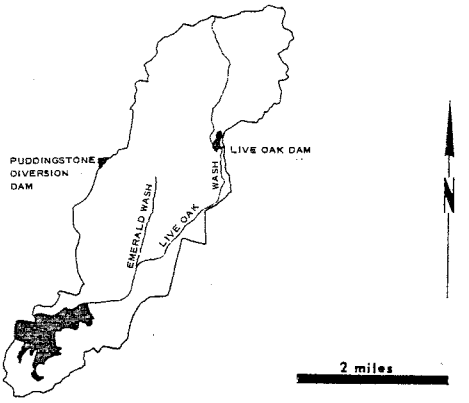
PUDDINGSTONE DAM AND RESERVOIR

drainage area



PURPOSE - Flood Control and Recreation

DATE CONSTRUCTED -
Started February 1925 - Completed January 1928

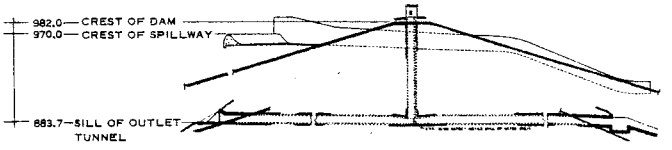
LOCATION - 1.0 mile south of San Dimas

DRAINAGE AREA - 11.0 square miles (uncontrolled)
22.1 square miles (controlled)
Total 33.1 square miles

CAPACITY - 16,856 acre-feet

SPILLWAY ELEVATION - 970.0 feet

cross-section



PUDDINGSTONE DAM

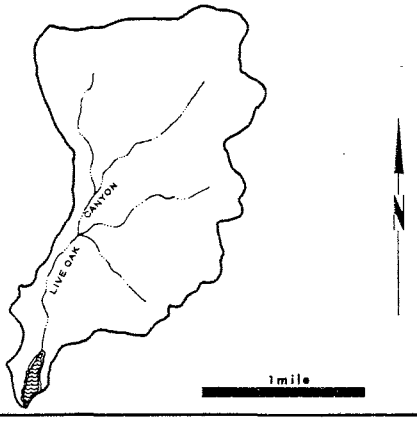
LIVE OAK DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started August 1921 - Completed November 1922

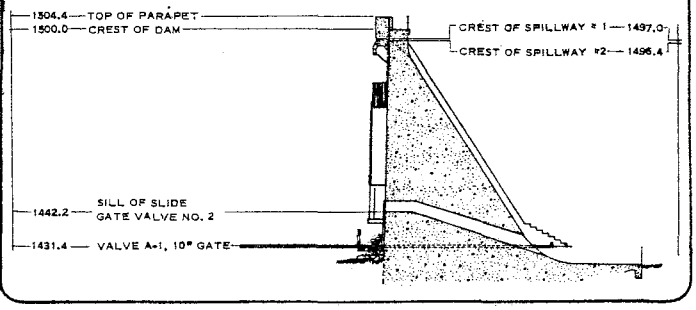
LOCATION - 2.5 miles northeast of La Verne

DRAINAGE AREA - 2.3 square miles

CAPACITY - 240 acre-feet

SPILLWAY ELEVATION - 1,496.0 feet

cross-section



LIVE OAK DAM

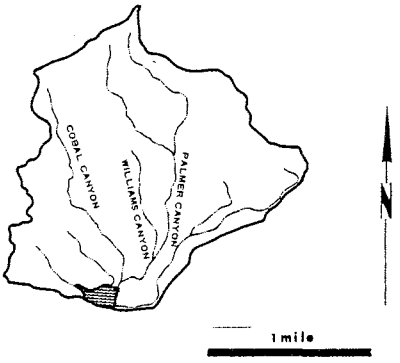
REMARKS: ( ) Indicates percolation and siltation losses.

THOMPSON CREEK DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started September 1925 - Completed March 1928

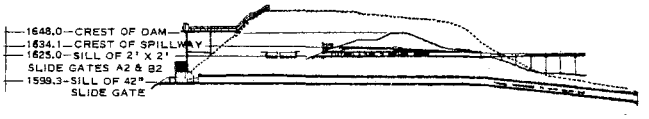
LOCATION - 3.0 miles north of claremont

DRAINAGE AREA - 3.5 square miles

CAPACITY - 447.5 acre-feet

SPILLWAY ELEVATION – 1,634.1 feet

cross-section



THOMPSON CREEK DAM

REMARKS:

EROSION CONTROL

FOREWORD

Each year eroded material in various forms (trees, rock, sand, etc.) flows out of the mountain watersheds of Los Angeles County. In an effort to control this potentially disruptive force, the District maintains a series of debris basins in canyon mouths and upstream stabilization structures in selected watersheds.

PURPOSE

The purpose of a debris basin is to entrap the debris flows emanating from the canyons and let the relatively desilted water pass into flood control channels for transportation to major watercourses. In the 1974-75 water year, 90 debris basins were in operation, 89 of which are operated and maintained by the District. Haines Debris Basin is operated and maintained bysthe Corps of Engineers. This figure represents an increase of 3 debris basins over the previous year. Afton, Chamberlain, and Fieldbrook Debris Basins were added to the list of District facilities during the year. The maximum capacity of all 90 debris basins is 8,543,000 cubic yards of which 7,695,000 cubic yards were available at the end of the water year.

STABILIZATION STRUCTURES

Stabilization structures are constructed to control erosion in natural canyons. They serve to prevent downcutting by stabilizing alluvium deposits. In addition, they store debris generated by the watershed and serve to stabilize side banks reducing side slope sloughing and bank erosion.

The District maintains 225 stabilization structures in 47 watersheds. No structures have been constructed since the 1973-74 water year.

(*) SEE FOOTNOTE (8) BELOW

(E) ESTIMATE

(1) NEW DEBRIS BASINS.
(2) VOLUME OF DEBRIS DEPOSITED IN BASIN DOES NOT INCLUDE DEBRIS WHICH PASSED OVER SPILLWAY DURING THE STORMS IN 1968-69 SEASON.
(3) INCLUDES DEBRIS FROM SANTA ANITA DAM.
(4) INCLUDES DEBRIS SLUICED FROM SAWPIT DAM.
(5) VOLUME OF DEBRIS DEPOSITED IN BASIN DOES NOT INCLUDE DEBRIS SLUICED THROUGH OPEN PORTS OR NOTCH.
(6) BASINS WILL BE ALLOWED TO FILL WITH DEBRIS AND ACT AS AN INLET STRUCTURE.
(7) APPROXIMATE DRAINAGE AREA INCLUDES MAJOR PORTION OF HASTINGS CANYON DRAINAGE AREA.
(8) EXCLUDES 6.03 SQUARE MILES OF DRAINAGE AREA CONTROLLED BY DEBRIS BASINS DESIGNATED BY (*).
(9) UNCONTROLLED DRAINAGE AREA IS BASED ON WEIGHTED AVERAGE OF THE VARIOUS AREA CHANGES RESULTING FROM DEBRIS BASIN CONSTRUCTION IN BRANCHES OF THE DRAINAGE OR OTHER CULTURAL CHANGES.

WATER QUALITY

WATER QUALITY OBLIGATION

The District created by an act of State Legislation is held with the responsibility of controlling flood, storm, and other waste water, and to conserve these waters for beneficial and useful purposes by spreading, storing, retaining, or to cause percolation into the soil within its jurisdictional area.

To successfully fulfill these obligations, this District has found it necessary to concern itself, not only with the quantities of the various conservable waters, but with their respective qualities as well.

Since its conception, this District has actively engaged in operations which have proven indispensable in preserving the integrity of our water resources, and has aided in the establishment of regulations or controlling criteria by those agencies so empowered.

WATER QUALITY ACTIVITIES

District activities in the field of water quality control are carried out by the Water Conservation Division, Water Quality Section. These activities include the collection of water quality samples, their analyses, and the interpretation and reporting of the resulting data. Areas of involvement include the monitoring of all groundwater basins through the sampling of numerous wells, the monitoring of storm and low water flows at various strategic locations on the major stream or channels, and an assumed or obligated duty to monitor the quality effects and subsurface travel of applied storm, imported and reclaimed water at this District's Whittier Narrows Spreading Grounds areas.

The Water Quality Section, together with personnel of other District divisions, also conduct investigations into pollutional problems, particularly those manifested from industrial discharges, vehicle accidents, ruptured pipelines, or from the indiscriminate dumping of various waste products.

The principal objectives of these investigations are to determine the degree and apparent source or origin of the pollution and to take the necessary action that will immediately abate the existing problem and possibly provide a means to prevent recurrence.

SURFACE WATER QUALITY

The Surface Water Quality Monitoring Program involves the sampling of dry weather flows of the principal water conveyance systems within the County area. Currently, samples are collected at 31 stations, located on the Los Angeles River San Gabriel River, Santa Clara River, Rio Hondo Channel, Coyote Creek, Dominguez Channel, Ballona Creek, Centinela Creek, San Jose Creek, Topanga Canyon Channel, Malibu Creek, and Kenter Avenue Drain. Samples are collected monthly at each station and analyzed by the District's Water Quality Laboratory for major minerals, total dissolved solids (TDS), total hardness, electrical conductivity, pH, dissolved oxygen demand, coliform, fecal coliform, and enterococci. In addition to these constituents, residual chlorine is also determined at selective locations as well as an annual analysis for trace metals.

A selective list of total dissolved solids is shown (Table 1) for some of the sampling locations on the streams and channels monitored under the Surface Water Quality Program. For a conception of the analysis performed on surface flows, a yearly compilation of constitutent determination is shown (Table 2) for one (Los Angeles River at 6th Street) of the 31 stations sampled.

To achieve an even greater insight into surface water quality, this District has recently supplemented the monthly monitoring program by including within this program a series of scheduled investigation tours on each of the major conveyance systems.

This work consists basically of traversing each of the principal streams and channels for compliance to existing water quality standards. Observations are also conducted on tributary systems, and the respective drainage areas.

STORM WATER QUALITY

The annual Storm Water Quality Program is a comprehensive sampling of major storm flows at many locations throughout the County. The samples are analyzed by the Water Quality Laboratory or by an independent laboratory for major minerals, electrical conductivity, suspended solids, pH, dissolved oxygen, biochemical oxygen demand, coliform, fecal coliform, enterococci, pesticides, herbicides, trace metals, oil and grease, chemical oxygen demand, and nutrients levels.

In addition, storm samples are taken at various gaging stations and spreading grounds. The flow data is recorded at the time each sample is taken and these samples are analyzed for electrical conductivity.

GROUND WATER QUALITY

The annual sampling of water wells, under a selected scheduling, in five major basins in Los Angeles County comprise the Ground-Water Quality Program. The program, initiated in 1970, is coordinated with the State of California Department of Water Resources and the City of Los Angeles Department of Water and Power.

These agencies participate in the obtainment and analysis of samples. All the water wells sampled are active production wells used either for municipal supply, irrigation, or for industrial purposes and are selected to represent a general portrayal of basin water quality conditions. The samples taken under this program are analyzed for major mineral, total dissolved solids, electrical conductivity, pH and, in some cases, phosphate, iron, manganese, fluoride, or boron.

WATER QUALITY DATA ACCESSIBILITY

Data acquired from these programs is on file in the Water Quality Section. Also, with the exception of TDS and bacteria, most data has been processed by the Department of Water Resources and is available on their computer generated listings. In addition, all data will be accessible to any user through STORET, an Environmental Protection Agency computer system that stores, retrieves, and manipulates data using agency code 21CALAFD.

WATER CONSERVATION

FOREWORD

Information presented in this section includes amounts of local, imported, and reclaimed water conserved in spreading grounds, spreading basins, reservoirs, and unlined channels. Also presented is information on the seawater barrier projects which prevent saltwater intrusion in the coastal area and information on the District's water quality monitoring programs of surface and ground water. Pertinent data are presented regarding the locations and descriptions of District conservation facilities, as well as facilities owned by others. Also, included are groundwater maps delineating elevations recorded during the report period, hydrographs of selected key wells, and maps indicating the District's water quality monitoring programs.

The various types of water conserved, namely, local, imported, and reclaimed, are construed to have the following meaning in this section. Local water is that derived from runoff due to rainfall on the mountain and valley watersheds within or tributary to the District. Reclaimed water is the effluent produced by Whittier Narrows Water Reclamation Plant and the San Jose Creek Water Renovation Plant, both operated by the Los Angeles County Sanitation Districts.

The rainfall during the water year 1974-75 was approximately 95 per cent of normal, and the local water conserved during this period was over 134,000 acre-feet.

San Gabriel River Spreading Grounds

SPREADING GROUNDS

The total gross acreage of spreading grounds owned and operated by the District during this annual report period amounted to 2,201 acres. The District also assisted in the operation and maintenance of 679 acres of spreading grounds owned by others. An additional 246 acres of spreading grounds are controlled, maintained, and operated by other agencies. The total gross acreage of spreading grounds in the County is 3,126 acres with a combined infiltration capacity of more than 2,403 cfs.

During the report period, the District continued its cooperation with the City of Pasadena Master Planning Committee in activities aimed toward the ultimate development of Arroyo Seco Spreading Grounds and Devil's Gate Reservoir.

IMPORTED WATER

During this annual period, imported Colorado River water and State Project water for spreading was obtained from The Metropolitan Water District. This water was purchased with funds provided by the Central and West Basin Water Replenishment District and the Upper San Gabriel Valley Municipal Water District. Prior to its termination, June 30, 1972, funds were also provided by the Water Conservation Zone I. The zone was established by the Board of Supervisors in January 1952 to finance the acquisition and conservation of untreated Colorado River water in the Coastal Plain. The funds were provided by taxation at a rate of $0.05 per $100 assessed value. The zone had a life of five years with provisions for renewal by the Board of Supervisors. Zone I was renewed three times before its termination in 1972.

Imported water for the Coastal Plain, purchased with funds from the Central and West Basin Water Replenishment District, was spread in the District's facilities in the Rio Hondo and San Gabriel River systems south of Whittier Narrows Dam.

Imported water for the San Gabriel Valley Ground-Water Basin, purchased by the Upper San Gabriel Valley Municipal Water District, was spread in Santa Fe Spreading Grounds and in the San Gabriel River between Morris Dam and the spreading grounds.

The San Gabriel Valley Municipal Water District made the first delivery of replacement water through their Devil Canyon-Azusa Pipeline on November 18, 1974, to the San Gabriel River. They also used their pipeline for the delivery of water for cyclic storage as per agreement with the watermaster. The Metropolitan Water District also used the pipeline for delivery of replenishment water for the Upper San Gabriel Valley Municipal Water District.

RECLAIMED WATER

The County Sanitation District's Whittier Narrows Water Reclamation Plant, in operation since 1962, produced from 12 to 18 mgd of high quality effluent during the annual period. The effluent is purchased by the Central and West Basin Water Replenishment District and transported to the Rio Hondo and San Gabriel River systems for groundwater replenishment.

The County Sanitation District's San Jose Creek Water Renovation Plant, activated in May 1972, made its first delivery of effluent in November of 1972. This effluent is also purchased by the Central and West Basin Water Replenishment District and is transported by pipeline to the San Gabriel River system for groundwater replenishment.

Reclaimed water comprised about 30 per cent of the total purchased water spread in the Montebello Forebay between October 1, 1974, and September 30, 1975.

BARRIER PROJECTS

The West Coast Basin Barrier Project, just inland of the Santa Monica Bay coastline, prevents the intrusion of ocean water into the fresh-water aquifers by the injection of State Project water to form a pressure barrier.

While the project is essentially completed within its approximate nine-mile reach covering the coastline from the Los Angeles International Airport to the base of the Palos Verdes Hills, construction of 11 injection wells and one observation well to provide additional protection and monitoring capabilities was in progress during this report period with operation scheduled for spring 1976. During the year, 26,434 acre-feet of fresh water was injected and the injection rate throughout the year averaged 37 cfs.

The Dominguez Gap Barrier Project was designed to prevent sea-water intrusion from the San Pedro Bay into the West Coast Basin through the Dominguez Gap area. Since the initiation of injection operations at the project in February 1971, some difficulty has been experienced in the ability to build the pressure ridge necessary to provide appropriate protection. (Nine shallow observation wells were constructed during the year. Deep observation wells at three sites (Unit 4) were under construction at the end of the report year. Four additional shallow observation wells will be constructed next year.) During the year, 5,161 acre-feet of fresh water was injected at an average rate of 7 cfs.

The existing operational facilities of the Alamitos Barrier Project consist of 18 injection wells and 4 extraction wells. The project facilities are designed to protect the ground water supplies of the Central Basin

of Los Angeles County and the Eastern Coastal Plain Basin of Orange County from intrusion of seawater through the Alamitos Gap area. During the year, 5,158.8 acre-feet of fresh water was injected at an average rate of 7 cfs and 153 acre-feet of saline water was extracted. Construction of the Orange County Water District extraction well was in progress and is expected to be in operation by January 1976.

EXPLORATION AND OBSERVATION WELLS

During this annual report period, 10 wells were drilled for monitoring groundwater levels and obtaining geologic data. These wells were constructed to replace important observation wells that have been destroyed.

SEASONAL DATA AND MAPS

During this annual report period, about 21,594 groundwater observations were obtained from approximately 2,758 wells. Hydrographs for selected key wells are included in this report.

GROUNDWATER BASINS

The natural underground water reservoirs underlying Los Angeles County consist of groundwater basins which are grouped under five local watersheds. These watersheds are identified as San Fernando Valley, San Gabriel Valley, Coastal Plain, Santa Clarita Valley, and Antelope Valley.

The following paragraphs relate the change in groundwater level as taken from wells which were chosen as representatives of average basin conditions. The change is measured as the difference in groundwater level occurring on October 1, 1975, as compared to the level which occured on October 1, 1974. These changes are shown on the basin maps pages 299 to 319. Some of the hydrographs used for determining the changes are shown on pages 269 to 291.

SAN FERNANDO VALLEY

The San Fernando Valley watershed overlies the San Fernando Main Basin and five sub-basins. The sub-basins are named Sylmar, Pacoima, Tujunga, Glenoaks, and Verdugo. The groundwater level was stable in the western portion of the San Fernando Valley but changes varying from 1 foot to -6 feet occured in other portions of the Valley.

See basin map on page 299.

SAN GABRIEL VALLEY

Eighteen groundwater basins exist under the San Gabriel Valley watershed. Groundwater levels decreased throughout most of these basins. The magnitude of some of the changes are shown on the basin map on page 301.

COASTAL PLAIN

Groundwater levels changes in the Coastal Plain varied throughout the basin. These changes are shown on the basin map on page 303.

SANTA CLARITA VALLEY

Groundwater levels in the main portion of the basin for this period have declined. However, the water level records as obtained from measurements in Well 7048A indicate that the water table in the Saugus area is still at the high level that occured during the 1969 storm.

ANTELOPE VALLEY

The Lancaster groundwater level as determined from measurements from Well 9962D has continued to decline. Decline for this report period is about six feet. Available record shows this declining trend continuing from 1921.

SUMMARY OF DATA ON SPREADING FACILITIES
OWNED AND OPERATED BY THE DISTRICT
UPDATED THROUGH SEPTEMBER 1975

GROUNDS	TYPE	SEASON FIRST USED	AREA IN ACRES		CAPACITIES				LOCATION	SOURCE OF WATER	REMARKS
			GROSS	WETTED	CHANNEL** CFS	INTAKE CFS	STORAGE A.F.	PERC.* CFS			
LOPEZ	SHALLOW BASINS	1956-57	18	13	-	25	25	7	SOUTHEASTERLY SIDE OF PACOIMA WASH, NORTHEASTERLY OF FOOTHILL BOULEVARD	CONTROLLED FLOW FROM PACOIMA DAM AND LOPEZ FLOOD CONTROL BASIN.	THE FLOW IS DIVERTED FROM LOPEZ FLOOD CONTROL BASIN VIA CANAL TO THE SPREADING GROUNDS.
PACOIMA	SHALLOW BASINS	1932-33	169	116	17,000	400	392	100	BOTH SIDES OF OLD PACOIMA WASH CHANNEL FROM ARLETA STREET SOUTHWESTERLY TO WOODMAN AVENUE.	CONTROLLED FLOW FROM PACOIMA DAM. PARTIALLY CONTROLLED FLOW FROM LOPEZ FLOOD CONTROL BASIN, UNCONTROLLED FLOW FROM EAST CANYON AND PACOIMA WASH.	FLOCCULANT FACILITY ADDED IN 1965-66
HANSEN	SHALLOW BASIN	1944-45	156	110	22,000	450	230	185	NORTHWESTERLY SIDE OF TUJUNGA WASH FROM ABOVE GLENOAKS BOULEVARD SOUTHWESTERLY TO SAN FERNANDO ROAD.	CONTROLLED FLOW FROM HANSEN DAM AND BIG TUJUNGA DAM.	GENERALLY WATER IS AVAILABLE FOR SPREADING ONLY DURING YEARS OF NORMAL OR ABOVE NORMAL RAINFALL. FLOCCULANT FACILITY ADDED IN 1971.
BRANFORD	DEEP BASIN	1956-57	12	8	1,540	1,540	179	1	SOUTHWESTERLY OF ARLETA STREET ABOVE CONFLUENCE OF TUJUNGA CHANNEL AND PACOIMA DIVERSION CHANNEL	UNCONTROLLED FLOWS FROM BRANFORD STREET DRAIN.	BASIN DEVELOPMENT 85 PER CENT COMPLETE. OUTLET CAPACITY 1540 CFS TO PACOIMA DIVERSION CHANNEL.
ARROYO SECO	SHALLOW BASINS	1948-49	24	13	-	100	30	15	EASTERLY SIDE OF ARROYO SECO, LOWER END 0.5 MILE ABOVE DEVIL'S GATE DAM.	UNCONTROLLED FLOW FROM ARROYO SECO AND THE ALTADENA STORM DRAIN, CONTROLLED FLOW FROM CITY OF PASADENA.	SPREADING GROUNDS ARE HELD UNDER EASEMENT FROM THE CITY OF PASADENA.
EATON WASH	DEEP AND SHALLOW BASINS	1947-48	28	24	6,600	100	525	20	EASTERLY SIDE OF EATON WASH FROM BELOW EATON DAM TO FOOTHILL BLVD.	CONTROLLED FLOW FROM EATON WASH DAM AND SIERRA MADRE VILLA CHANNEL.	THREE DEEP BASINS COMPRISE 15 ACRES. THE SHALLOW STRIP BASINS TOTAL 13 ACRES.
SANTA ANITA	SHALLOW BASINS	1944-45	20	8	-	20	25	7	WESTERLY SIDE OF SANTA ANITA WASH 1.25 MILES ABOVE FOOTHILL BOULEVARD.	CONTROLLED FLOW FROM SANTA ANITA DAM AND SANTA ANITA DEBRIS DAM.	THE HEADWORKS LOCATED UPSTREAM OF THE DEBRIS DAM DIVERTS WATER TO SANTA ANITA SPREADING GROUNDS AND CITY OF SIERRA MADRE SPREADING GROUNDS.
SAWPIT	SHALLOW BASINS	1946-47	12	4	-	30	13	12	WESTERLY SIDE OF SAWPIT WASH BELOW MOUTH OF CANYON AT HEAD OF NORUMBEGA STREET, MONROVIA.	CONTROLLED FLOWS FROM SAWPIT DAM AND SAWPIT DEBRIS DAM.	
SAN GABRIEL CANYON	DITCHES AND CHECKS	ABOUT 1917	165	-	-	-	-	35	EASTERLY SIDE OF SAN GABRIEL RIVER, BELOW MOUTH OF CANYON. NORTH OF THE CITY OF AZUSA.	SAN GABRIEL RIVER CONTROLLED RELEASES FROM COGSWELL DAM, SAN GABRIEL DAM, AND MORRIS DAM.	THE DISTRICT TOOK OVER OPERATION OF THIS FACILITY IN NOVEMBER 1969. RECEIVES SURPLUS WATER FROM THE WATER RIGHTS OF THE COMMITTEE OF NINE.
LITTLE DALTON	SHALLOW BASINS, DITCHES, AND CHECKS	1931-32	14	4.7	-	20	5	10	WESTERLY OF GLENDORA MT. ROAD, FROM LITTLE DALTON DEBRIS DAM SOUTH TO EAST PALM DRIVE.	CONTROLLED FLOW FROM LITTLE DALTON DEBRIS DAM.	
BIG DALTON	SHALLOW BASINS, DITCHES, AND CHECKS	1930-31	24	13	-	45	25	15	WESTERLY SIDE OF BIG DALTON WASH. INTAKE ONE HALF MILE ABOVE SIERRA MADRE AVENUE.	CONTROLLED FLOWS FROM BIG DALTON DAM AND BIG DALTON DEBRIS DAM.	
LIVE OAK	SHALLOW BASINS	1961-62	5	2	-	15	2	5	WESTERLY SIDE OF LIVE OAK WASH, NORTH OF BASE LINE ROAD (PROJECTED).	CONTROLLED FLOW FROM LIVE OAK DAM AND LIVE OAK DEBRIS DAM.	
LAGUNA	SHALLOW BASINS	1962-63	6	3	-	-	5	1	EAST SIDE LONG BEACH FREEWAY, ONE HALF MILE NORTH OF BROOKLYN AVENUE.	LOCAL RUNOFF FROM ALHAMBRA AND EL SERENO VIA DORCHESTER DRAIN.	THE PIT IN WHICH BASINS ARE LOCATED WAS DESIGNED AS A RETENTION BASIN FOR THE DORCHESTER STORM DRAIN.
EATON BASIN	DEEP BASIN	1956-57	16	10.6	9,600	400	280	10	EAST SIDE OF EATON CHANNEL NORTH OF DUARTE ROAD, 0.6 MILE SOUTH OF HUNTINGTON DRIVE.	CONTROLLED FLOW FROM EATON WASH DAM AND UNCONTROLLED FLOWS BETWEEN DAM AND SPREADING BASIN.	
PECK ROAD	DEEP BASIN	1959-60	157	85	30,100	30,100	3,347	17	CONFLUENCE OF SAWPIT AND SANTA ANITA WASHES.	ALL FLOWS IN SAWPIT AND SANTA ANITA WASHES.	INFILTRATION CAPACITY DETERIORATED AFTER FEBRUARY 1969.
BUENA VISTA	DEEP BASIN	1954-55	10	6	2,900	2,900	194	8	1.0+ MILE EASTERLY OF SAWPIT WASH. 0.5+ MILE NORTHERLY OF ARROW HIGHWAY, BETWEEN MERIDIAN STREET AND BUENA VISTA CHANNEL.	CONTROLLED FLOW FROM SANTA FE DAM AND UNCONTROLLED FLOW FROM BUENA VISTA CHANNEL.	NO OUTFLOW EXPECTED EXCEPT CAPITAL STORM, BUT A SMALL OUTLET STRUCTURE OF 150 CFS PROVIDED. INLET CAPACITY OF SANTA FE DIVERSION 120 CFS.

*THE CAPACITIES LISTED ARE BASED ON INFILTRATION RATES WHICH MAY BE EXPECTED TO PERSIST FOR AT LEAST FIVE DAYS BUT ARE NOT VALID FOR SUSTAINED SPREADING OPERATIONS.

**DESIGN CAPACITY OF MAIN CONCRETE CHANNEL.

(A) Beginning in 1958-59, this excludes canyon water spread at Ben Lomond.

(B) Operated by Pomona Valley Protective Association.

(C) Water spread, no records kept.

(D) Daily measurements made. Total volume not computed.

(E) East Side Water Committee discontinued keeping records as of 1959-60 season. The San Gabriel Spreading Corporation was dissolved in the Spring of 1965. The canyon basin spreading grounds were then operated by The Committee of Nine until November 1969, at which time the Flood Control District took over operations.

(F) Water spread, records not available.

(G) Previously to 1969-70 Fish Canyon Spreading Grounds records were incorporated into San Gabriel Canyon Spreading Grounds.

(H) The District took over operation of this facility in November 1969.

(J) Record supplied by Pomona Valley Protective Association.

(A) Includes Metropolitan Water District water purchased under contract with San Gabriel Valley Labor Association.

(B) San Dimas Canyon water spread prior to 1965-66 in temporary development below Puddingstone Diversion.

(C) San Dimas Spreading development inoperative after 1968 - 69 water year.

(D) San Gabriel River from Santa Fe Dam to rising water. Hook levees developed in river, 1965.

(E) San Gabriel River from Whittier Narrows Dam to Florence Avenue; (Hook levees developed in river, 1954) and the San Gabriel Coastal Spreading Grounds.

(F) Spreading grounds only up through 1967-68 water year, thereafter figures include Whittier Narrows Dam (Rio Hondo side) percolation.

(a) San Gabriel River from Morris Dam to Santa Fe Spreading Grounds

(b) Includes unidentifiable minor losses.

(c) 6,500 Acre Feet make-up water purchased by the Upper San Gabriel Valley Municipal Water District and spread in the lower San Gabriel System.

(d) Rio Hondo Spreading Grounds and Whittier Narrows Reservoir.

(a) Differences between water distributed and water financed due to the following:

1. Water temporarily held in storage at Puddingstone Reservoir from one water year to the next.
2. Losses in Puddingstone Reservoir.
3. District records are based on 12 midnight readings, amounts shown under Financing Column are based on meter readings taken during normal working hours.
4. Includes unidentifiable minor losses.

(b) Rio Hondo Spreading Grounds and Whittier Narrows Reservoir.

(c) All reclaimed water purchased by Central and West Basin Water Replenishment District.

(d) 6,500 Acre Feet make-up water purchased by the Upper San Gabriel Valley Municipal Water District and Spread in the lower San Gabriel System.

SANTA CLARITA VALLEY

WATER LEVEL CHANGES IN KEY WELLS AND GROUNDWATER BASINS

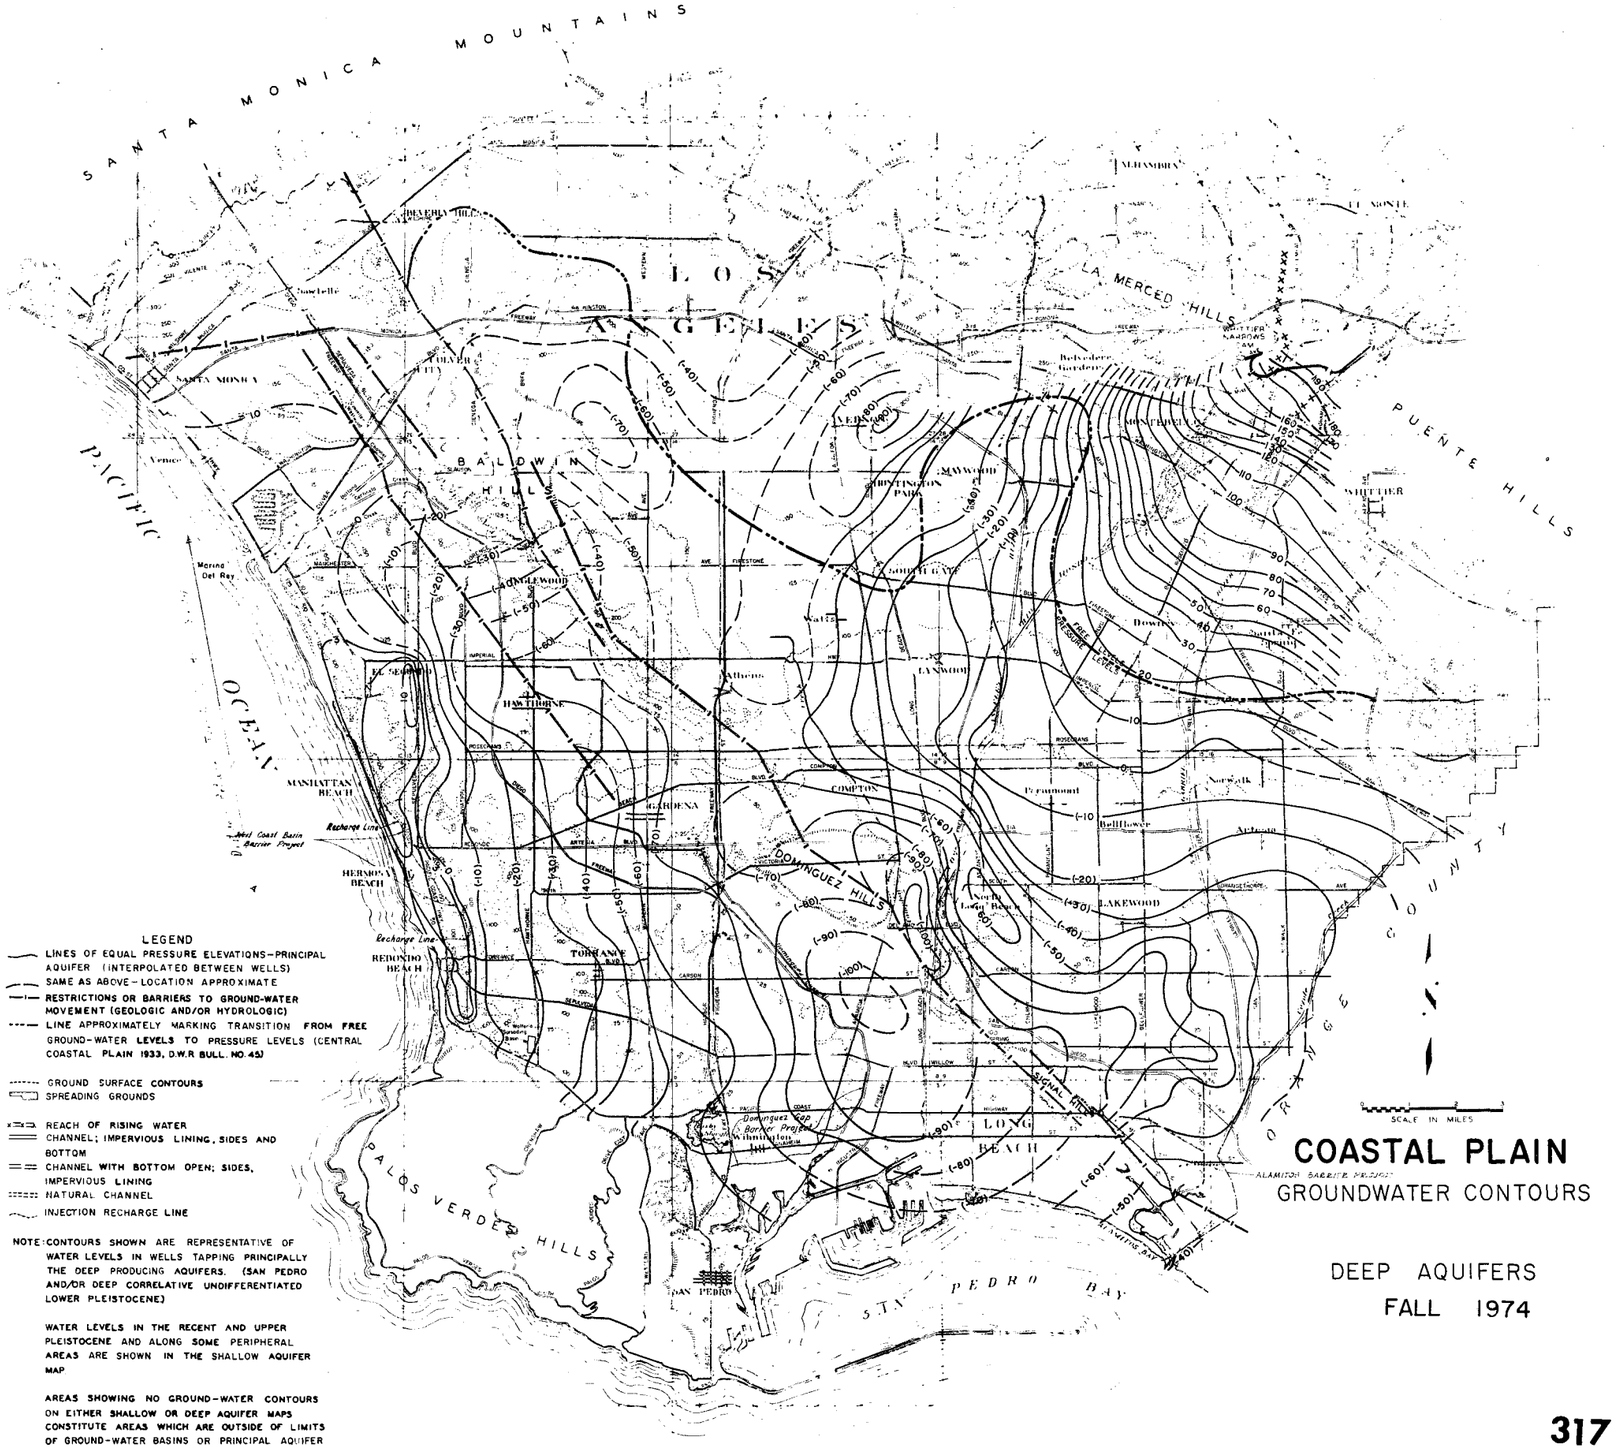
COASTAL PLAIN
GROUNDWATER CONTOURS

SHALLOW AQUIFERS
FALL 1974



LEGEND

- LINES OF EQUAL PRESSURE ELEVATIONS—PRINCIPAL AQUIFER (INTERPOLATED BETWEEN WELLS)
- SAME AS ABOVE—LOCATION APPROXIMATE
- RESTRICTIONS OR BARRIERS TO GROUND-WATER MOVEMENT (GEOLOGIC AND/OR HYDROLOGIC)
- LINE APPROXIMATELY MARKING TRANSITION FROM FREE GROUND-WATER LEVELS TO PRESSURE LEVELS (CENTRAL COASTAL PLAIN 1933, D.W.R BULL. NO. 45)
- GROUND SURFACE CONTOURS
- SPREADING GROUNDS
- REACH OF RISING WATER
- CHANNEL; IMPERVIOUS LINING, SIDES AND BOTTOM
- CHANNEL WITH BOTTOM OPEN; SIDES, IMPERVIOUS LINING
- NATURAL CHANNEL
- INJECTION RECHARGE LINE

NOTE: CONTOURS SHOWN ARE REPRESENTATIVE OF WATER LEVELS IN WELLS TAPPING PRINCIPALLY THE DEEP PRODUCING AQUIFERS. (SAN PEDRO AND/OR DEEP CORRELATIVE UNDIFFERENTIATED LOWER PLEISTOCENE)

WATER LEVELS IN THE RECENT AND UPPER PLEISTOCENE AND ALONG SOME PERIPHERAL AREAS ARE SHOWN IN THE SHALLOW AQUIFER MAP

AREAS SHOWING NO GROUND-WATER CONTOURS ON EITHER SHALLOW OR DEEP AQUIFER MAPS CONSTITUTE AREAS WHICH ARE OUTSIDE OF LIMITS OF GROUND-WATER BASINS OR PRINCIPAL AQUIFER OR FOR WHICH THERE IS INSUFFICIENT INFORMATION.
